Additional Material

Primary diagnosis dataset: 3355 captures / 299 configurations.
Mean dual-polarization BER below 0.024: 2224 accepted captures / 246 configurations.

Part A: classification, setting-resolved detection, operating-condition transfer, and BER.
Part B: configuration-indexed representative constellations.

Results use saved predictions and derived communication-quality outputs. The reference BER does not constitute a measured post-FEC guarantee.

Five-class recall and binary fault F1 are distinct metrics. Full and low-BER setting curves each use their own common operating support. Confidence intervals condition on the fitted predictions and resample configurations.

Each BER point summarizes accepted repeats at one configuration, with the available-repeat count reported. Constellation panels show recovered symbols. Configurations without accepted DSP outputs remain listed in the index.

The complete per-capture and per-configuration tables accompany the analysis materials. Configuration identifiers link the tables and figures.

Contents | results and communication quality

S1.1 | Complete primary-set class and distance coverage 14

S1.2 | Feature--label correlations | primary set 15

S1.3 | Feature--label correlations | common support 16

S1.4 | Feature--feature correlations | primary set 17

S2.1 | BER threshold | capture-level distribution and membership 18

S2.2 | BER | Normal operation 19

S2.3 | BER | VOA attenuation 20

S2.4 | BER | EDFA gain reduction 21

S2.5 | BER | WSS center offset 22

S2.6 | BER | WSS bandwidth narrowing 23

S2.7 | BER versus setting | QPSK and 16QAM at 640/960 km 24

S2.8 | Recovered constellations | all 17 settings 25

S3.1 | Five-class recognition versus setting 26

S3.2 | Binary detection versus setting 27

S3.3 | Exact-condition detection | exact magnitude full attenuation 28

S3.4 | Exact-condition detection | exact magnitude full edfa 29

S3.5 | Exact-condition detection | exact magnitude full WSS bandwidth 30

S3.6 | Exact-condition detection | exact magnitude full WSS offset 31

S3.7 | Exact-condition detection | exact magnitude low BER attenuation 32

S3.8 | Exact-condition detection | exact magnitude low BER edfa 33

S3.9 | Exact-condition detection | exact magnitude low BER WSS bandwidth 34

S3.10 | Exact-condition detection | exact magnitude low BER WSS offset 35

S4.1 | Signal versus metadata and power controls 36

S4.2 | Paired distance transfer with and without spectra 37

S5.1 | Acquisition-date and training-cohort comparisons 38

S6.1 | Reference classification 39

S6.2 | Five-class confusion matrices 40

S6.3 | Signal-representation comparison 41

Contents | results and communication quality

S6.4 | Held-out operating-condition values 42

S6.5 | Complete operating-condition holdout 43

S6.6 | Within-condition models | within condition 44

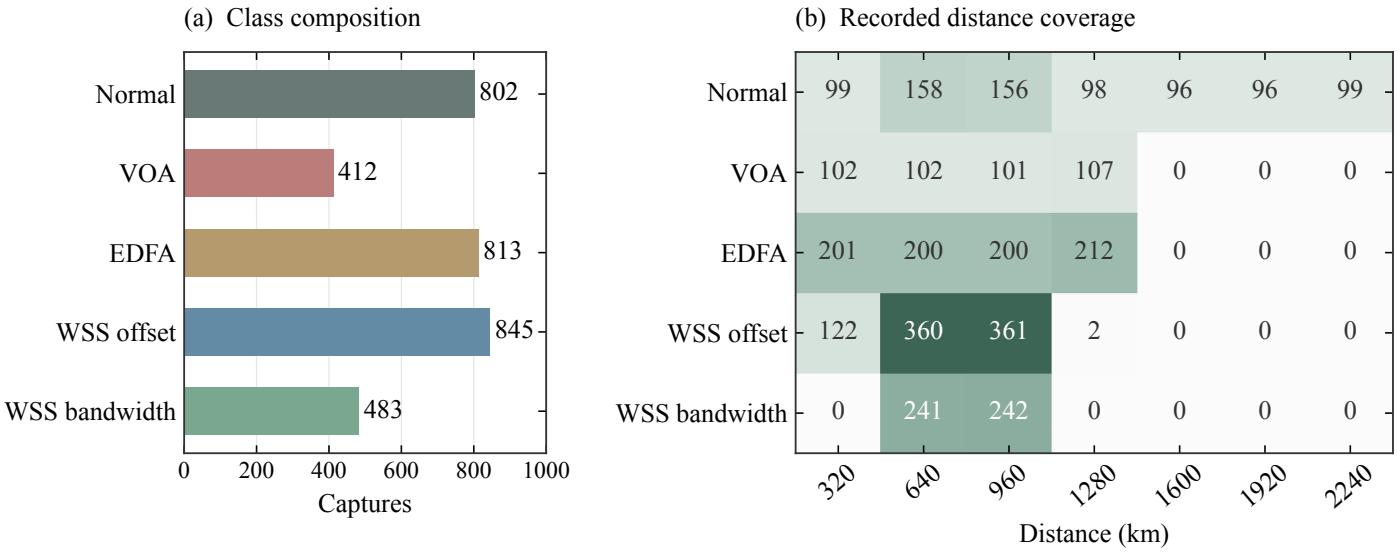
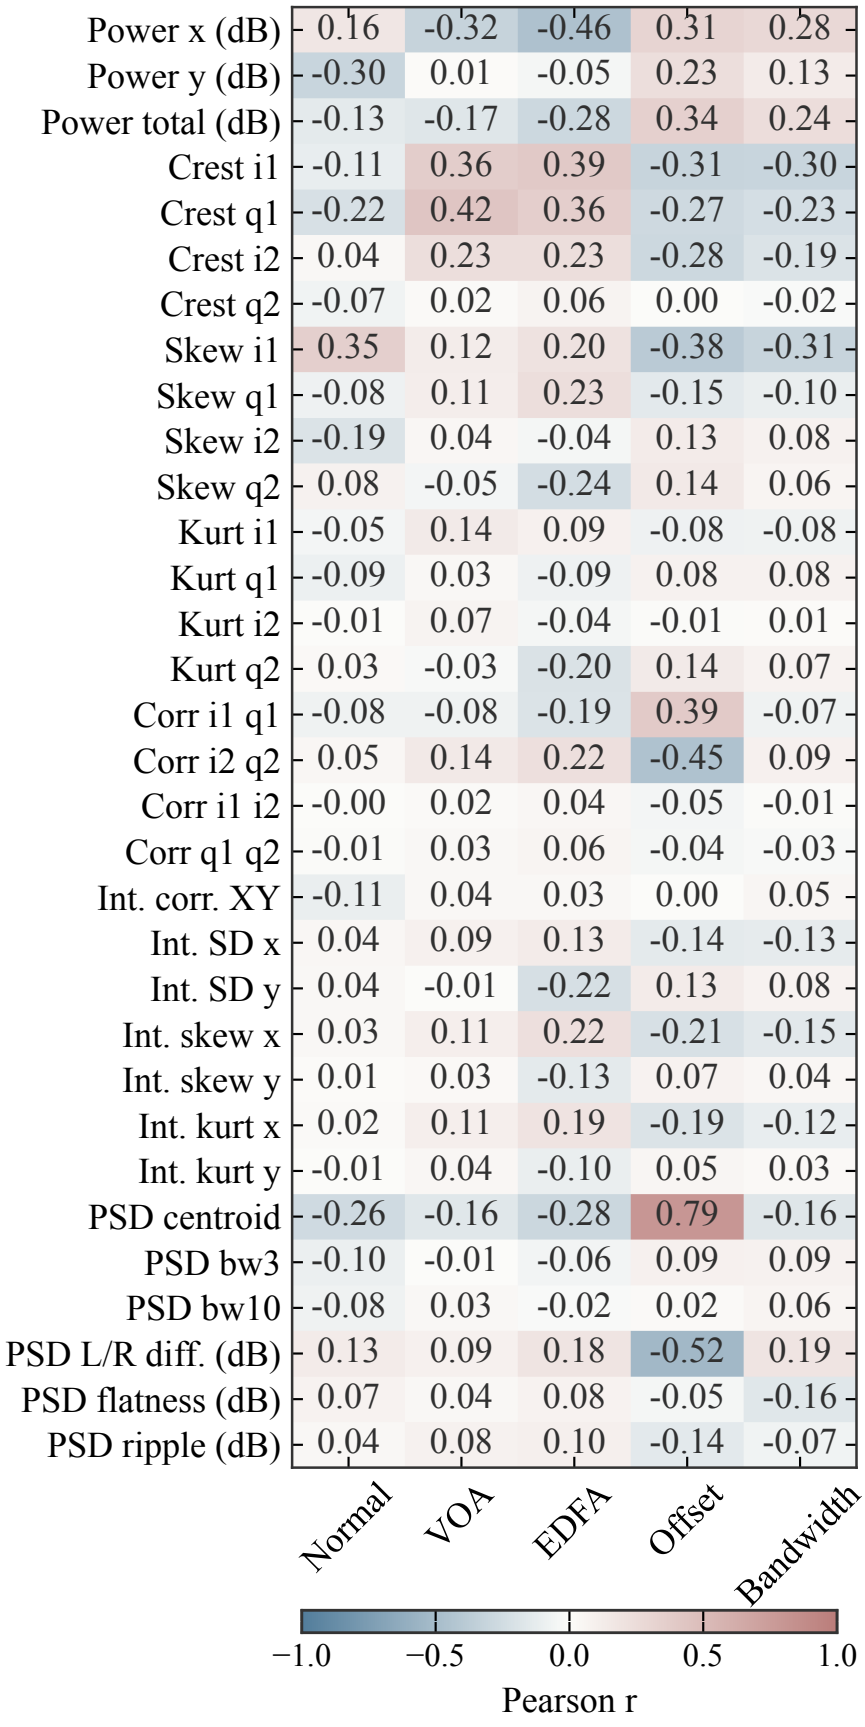
S1.1 | Complete primary-set class and distance coverage



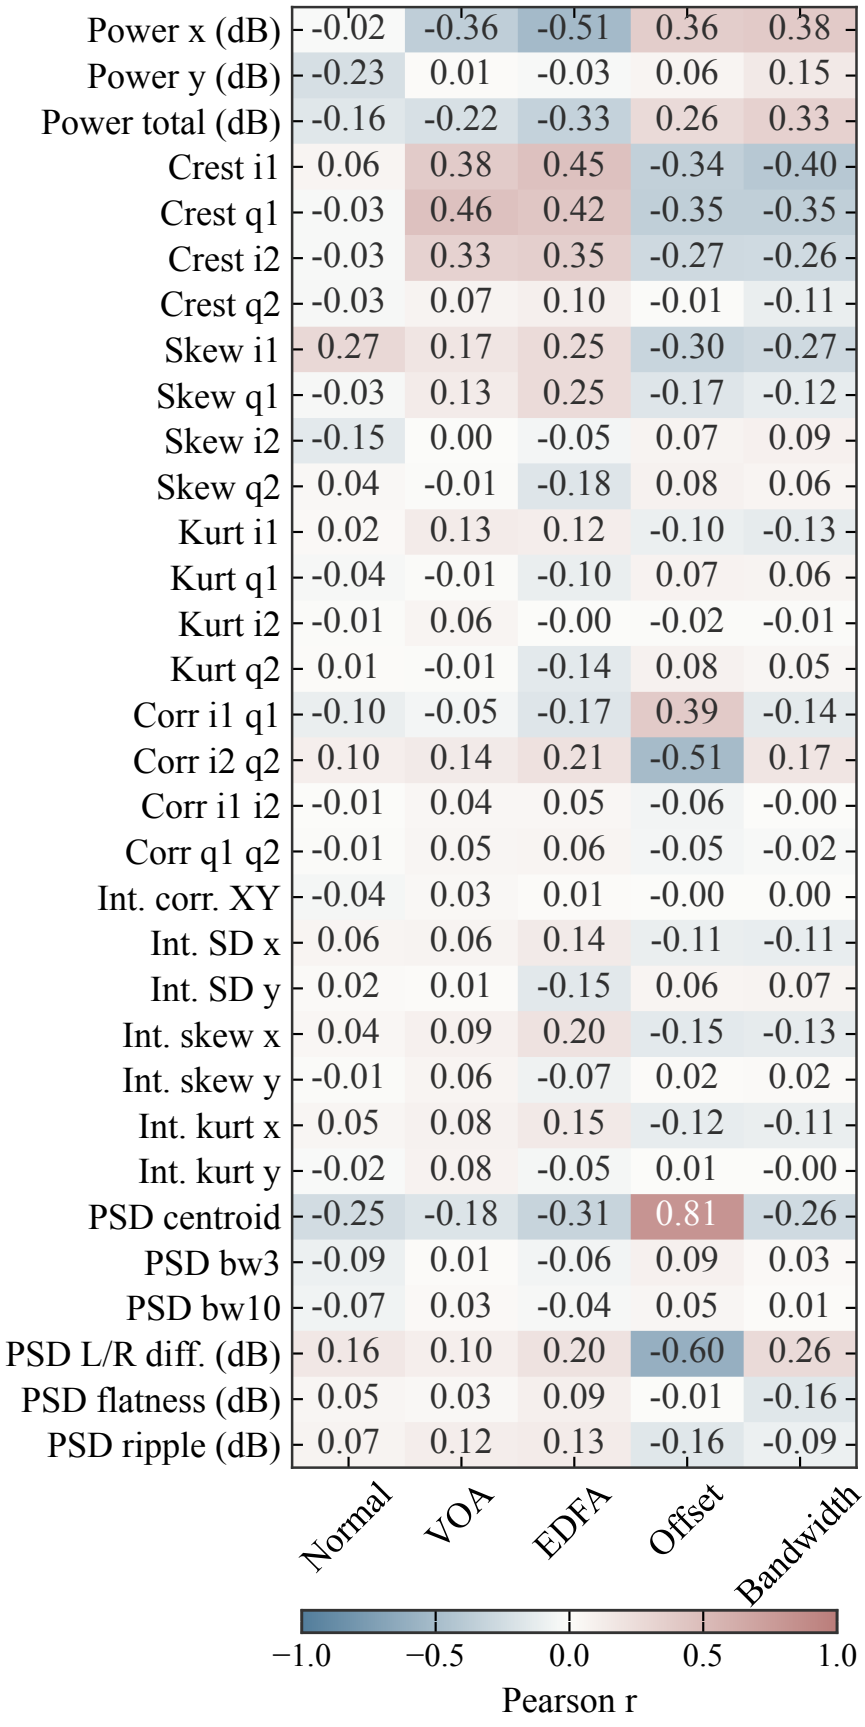
Results are grouped by the operating conditions and evaluation protocol indicated in the figure. Configuration identifiers link the figures to the accompanying data tables.

S1.2 | Feature--label correlations | primary set



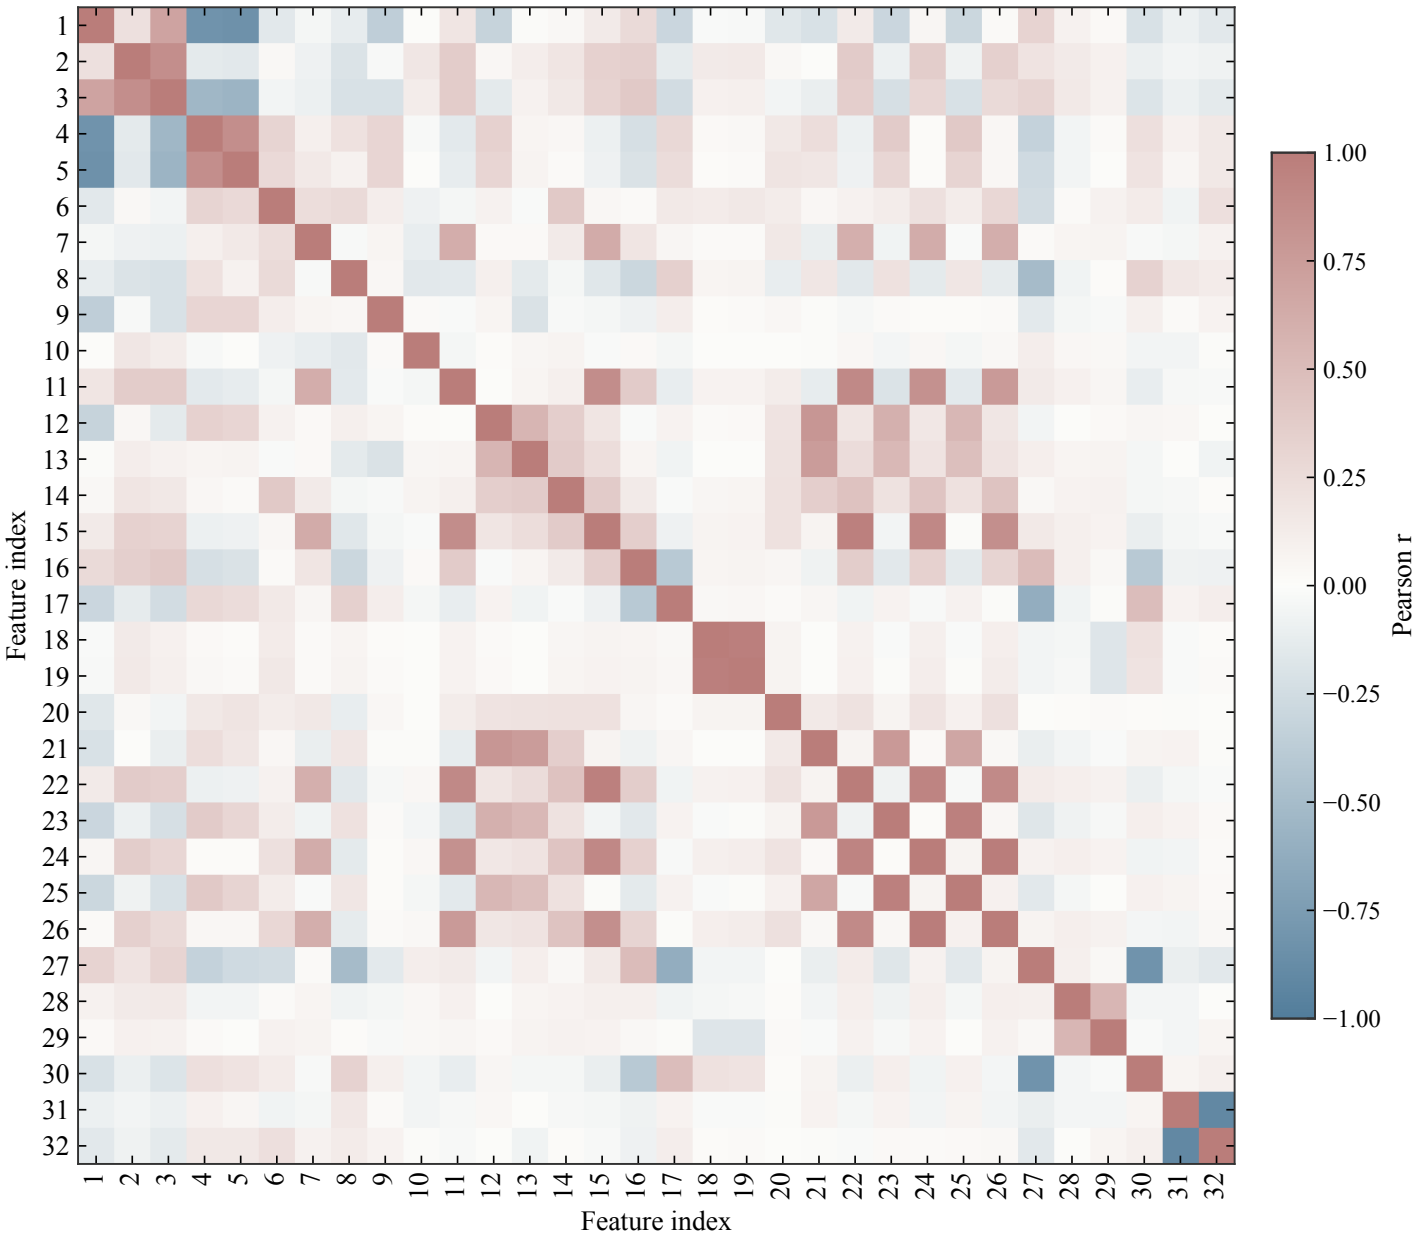
Pearson correlations with separate binary class indicators, not ordinal class codes. Shared [-1,1] scale. Sample associations are descriptive; they are not a causal estimate or held-out classifier performance.

S1.3 | Feature--label correlations | common support



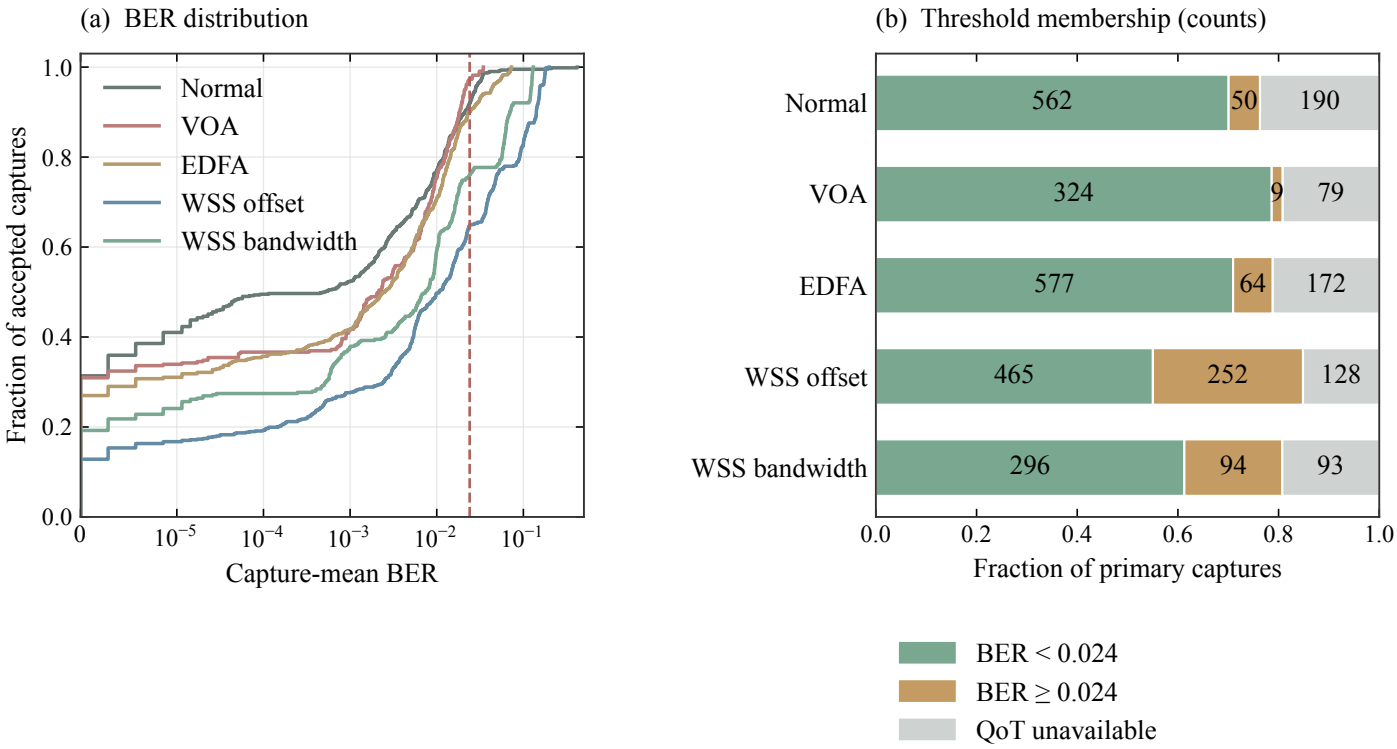
Pearson correlations with separate binary class indicators, not ordinal class codes. Shared [-1,1] scale. Sample associations are descriptive; they are not a causal estimate or held-out classifier performance.

S1.4 | Feature--feature correlations | primary set



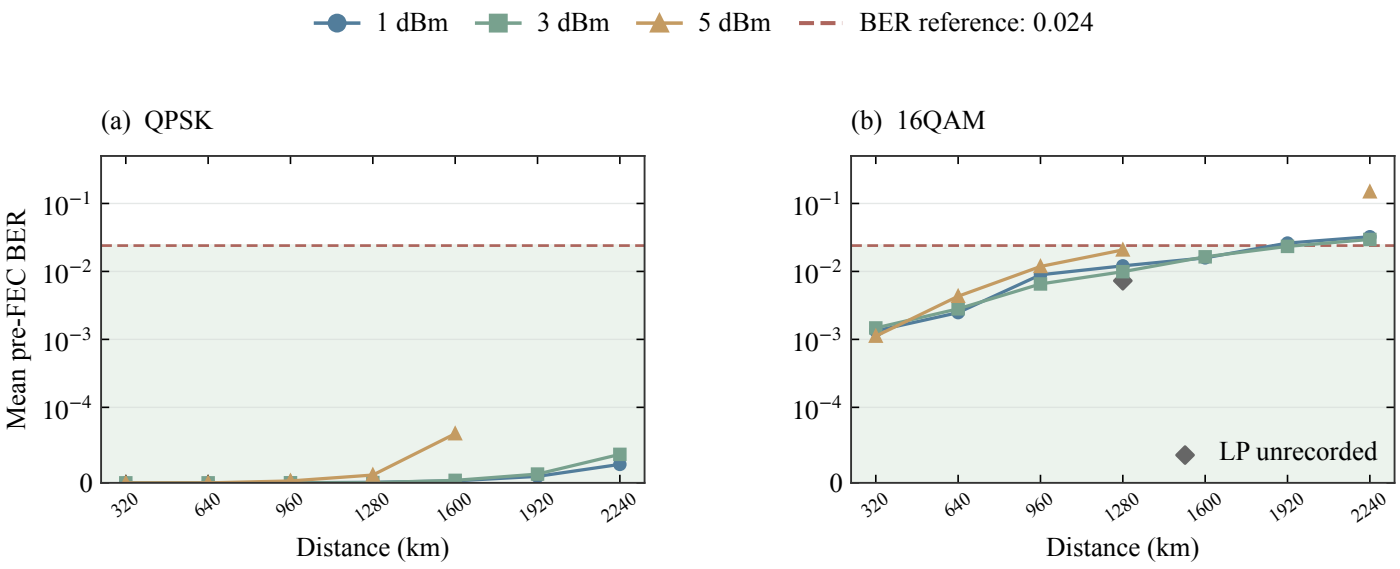
Pearson correlations among the 32 retained descriptors in 3355 primary captures. Feature indices are listed on the next reference page. No feature selection is performed from this descriptive matrix.

S2.1 | BER threshold | capture-level distribution and membership



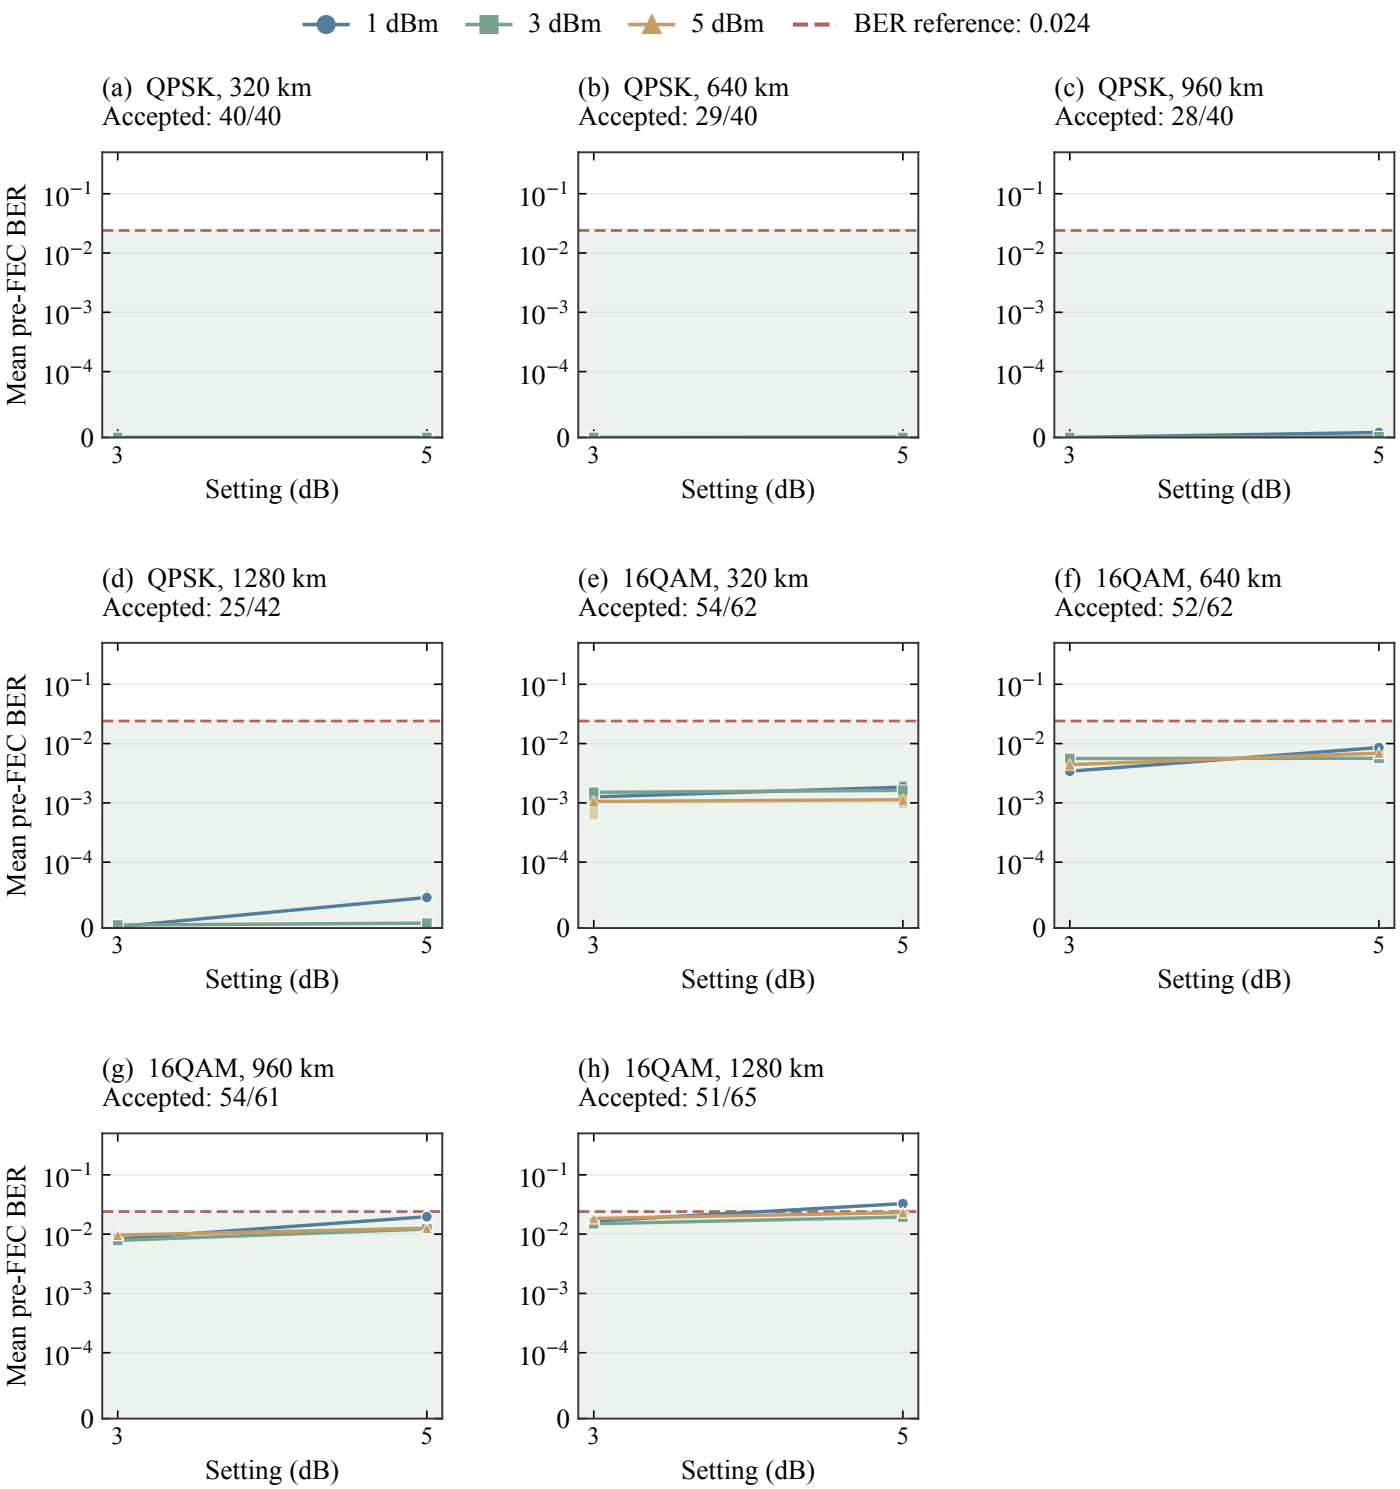
Left: empirical BER distributions among accepted captures. Right: primary capture counts partitioned into below-reference, at/above-reference, and no accepted QoT. This selection is per capture, not per configuration mean.

S2.2 | BER | Normal operation



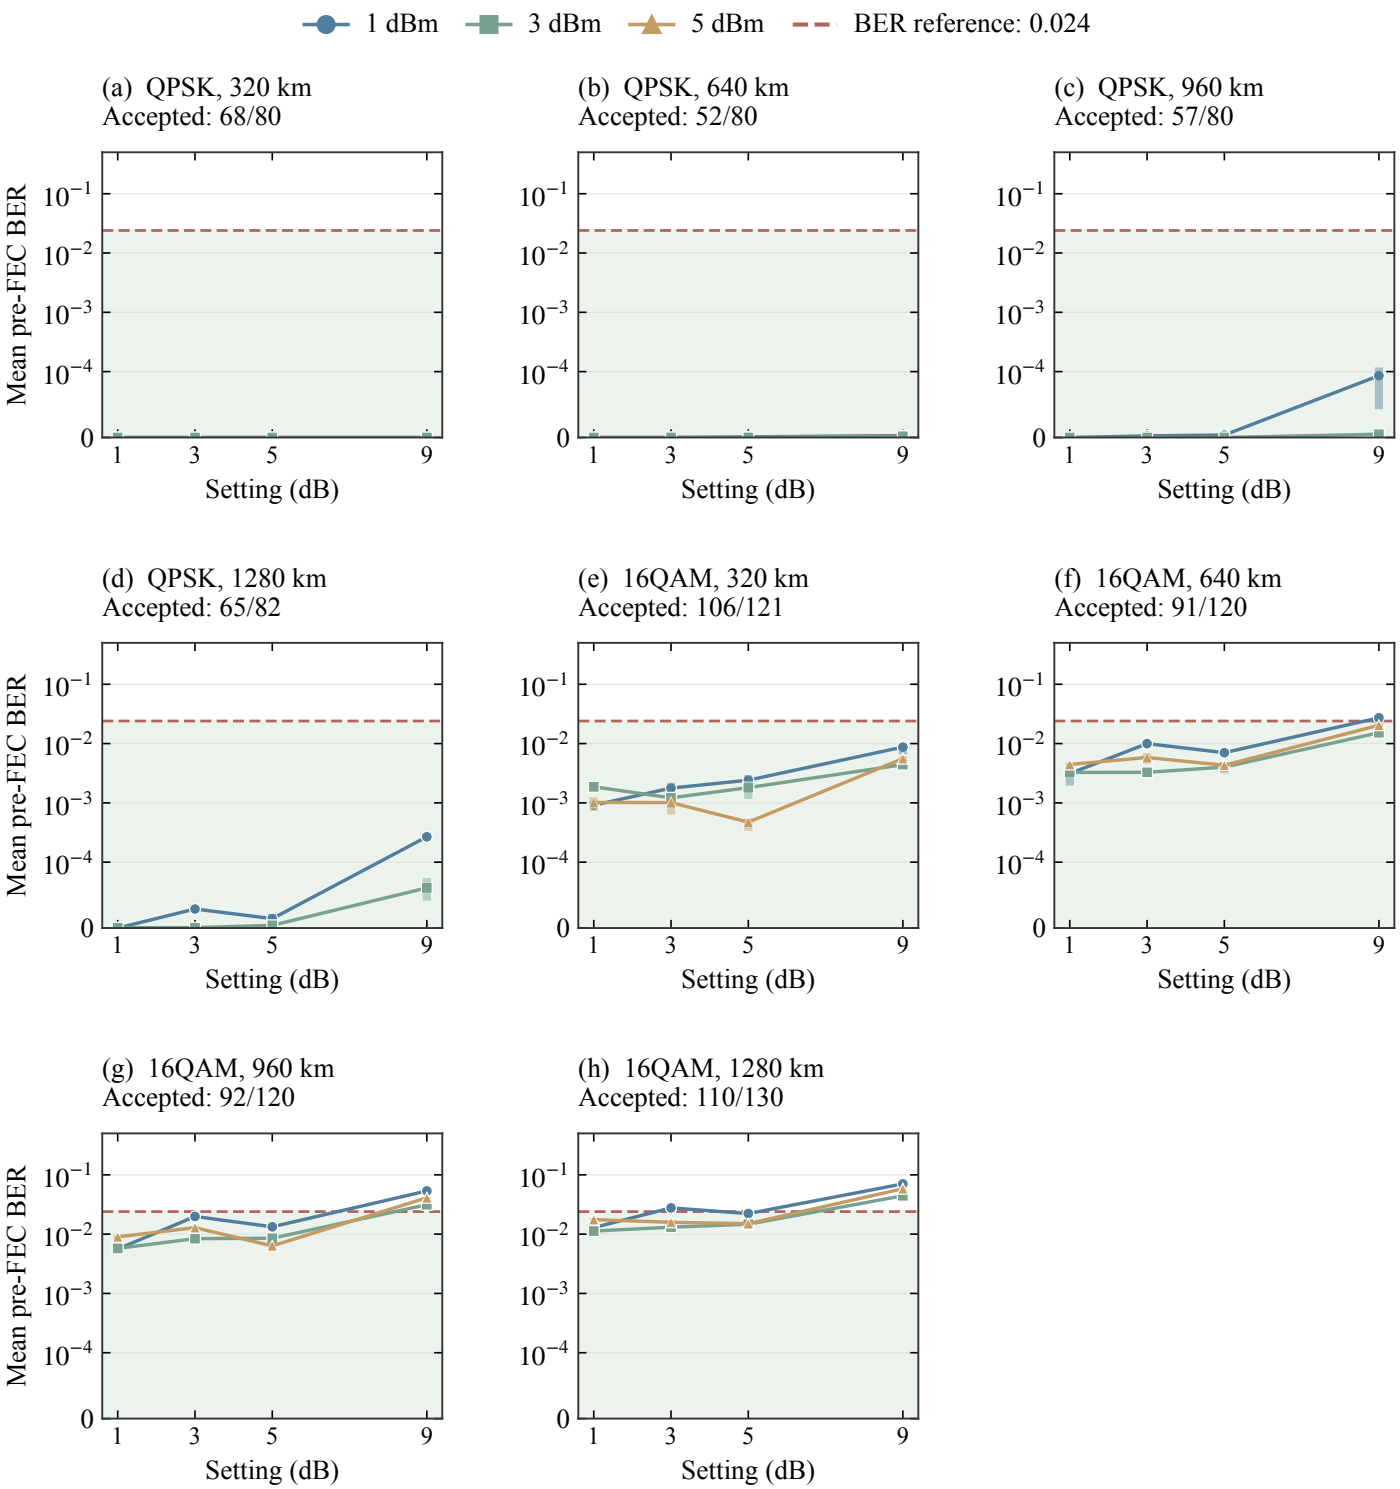
Normal-operation BER for QPSK and 16QAM only. Additional sparse acquisitions remain in the complete configuration index. The full model retains all 3355 primary captures.

S2.3 | BER | VOA attenuation



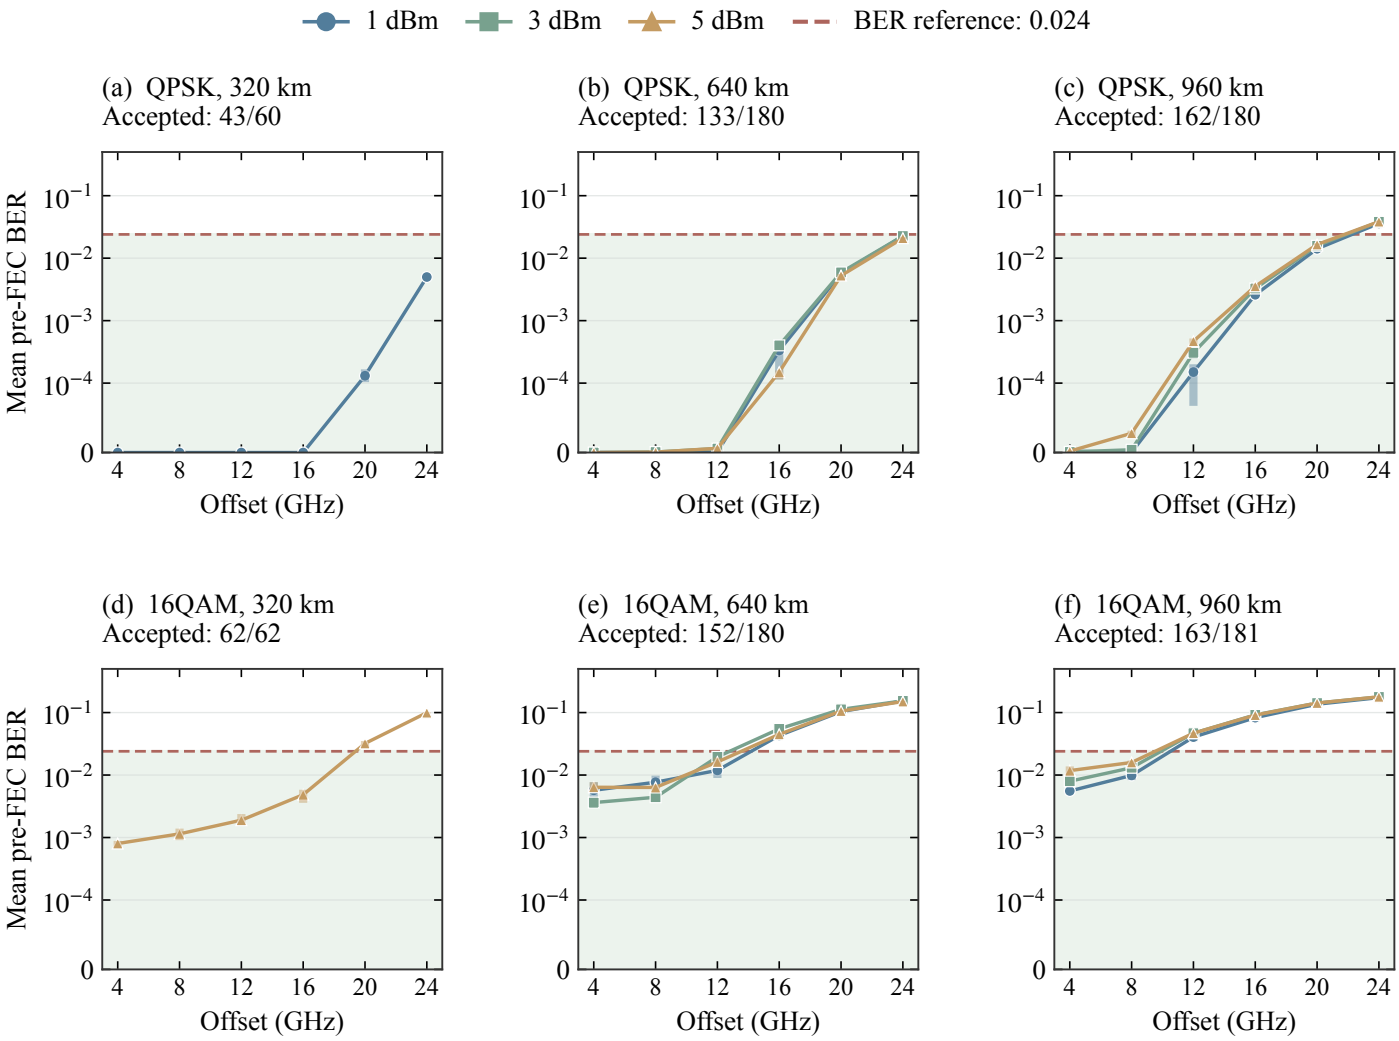
Fault panels fix modulation and distance; curves identify launch power. Points are accepted-repeat means; spans are interquartile ranges, not confidence intervals. Dashed reference: 0.024. Missing is not zero.

S2.4 | BER | EDFA gain reduction



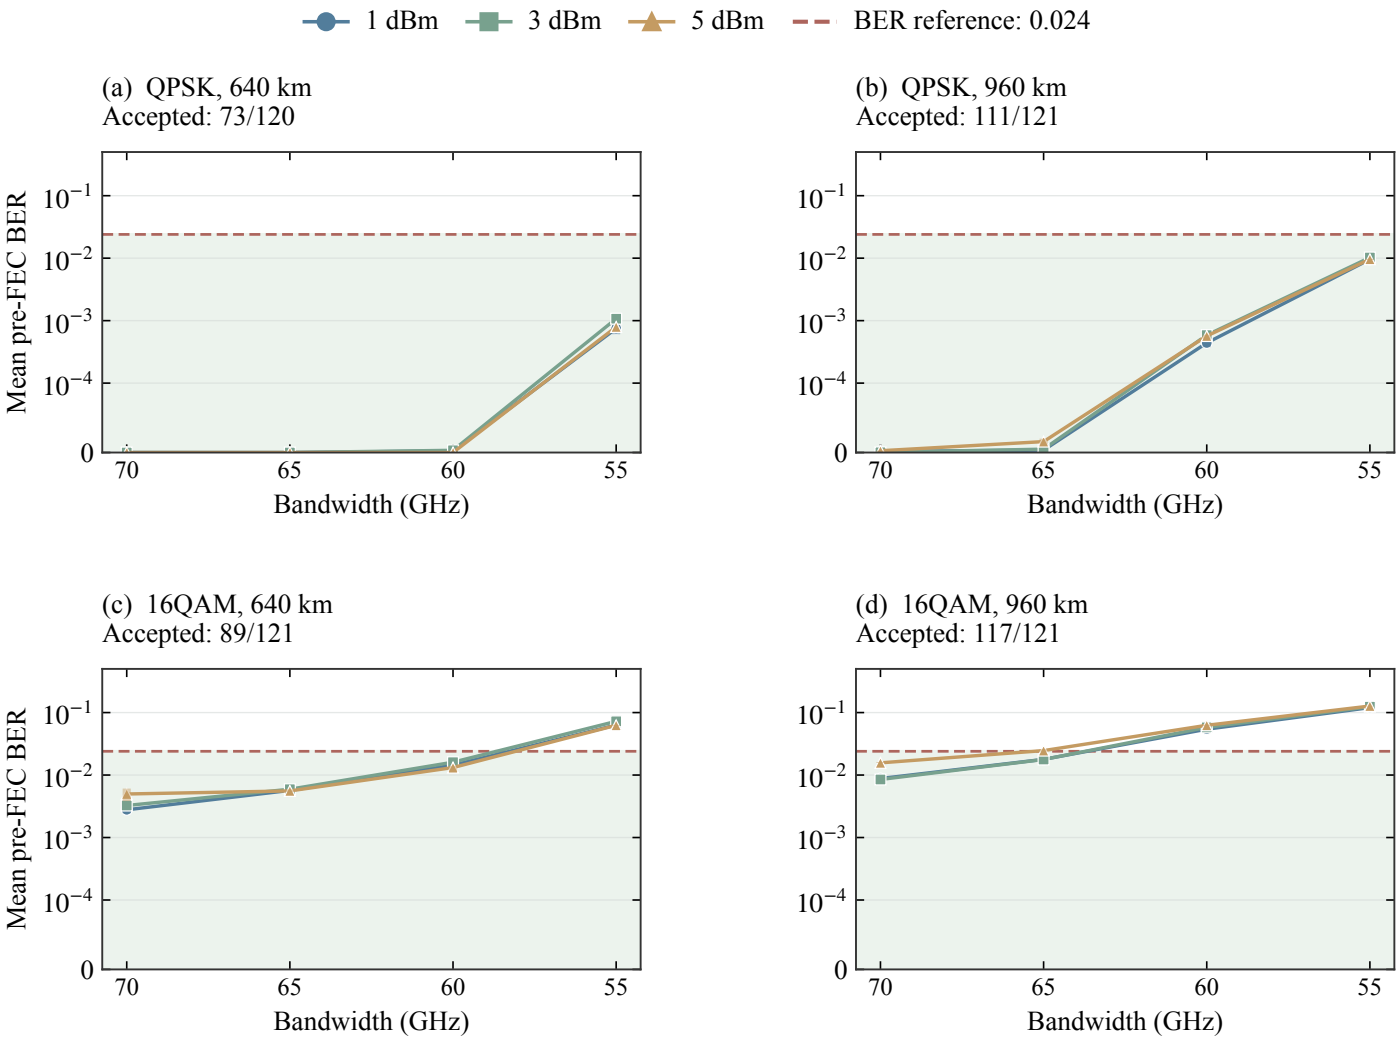
Fault panels fix modulation and distance; curves identify launch power. Points are accepted-repeat means; spans are interquartile ranges, not confidence intervals. Dashed reference: 0.024. Missing is not zero.

S2.5 | BER | WSS center offset



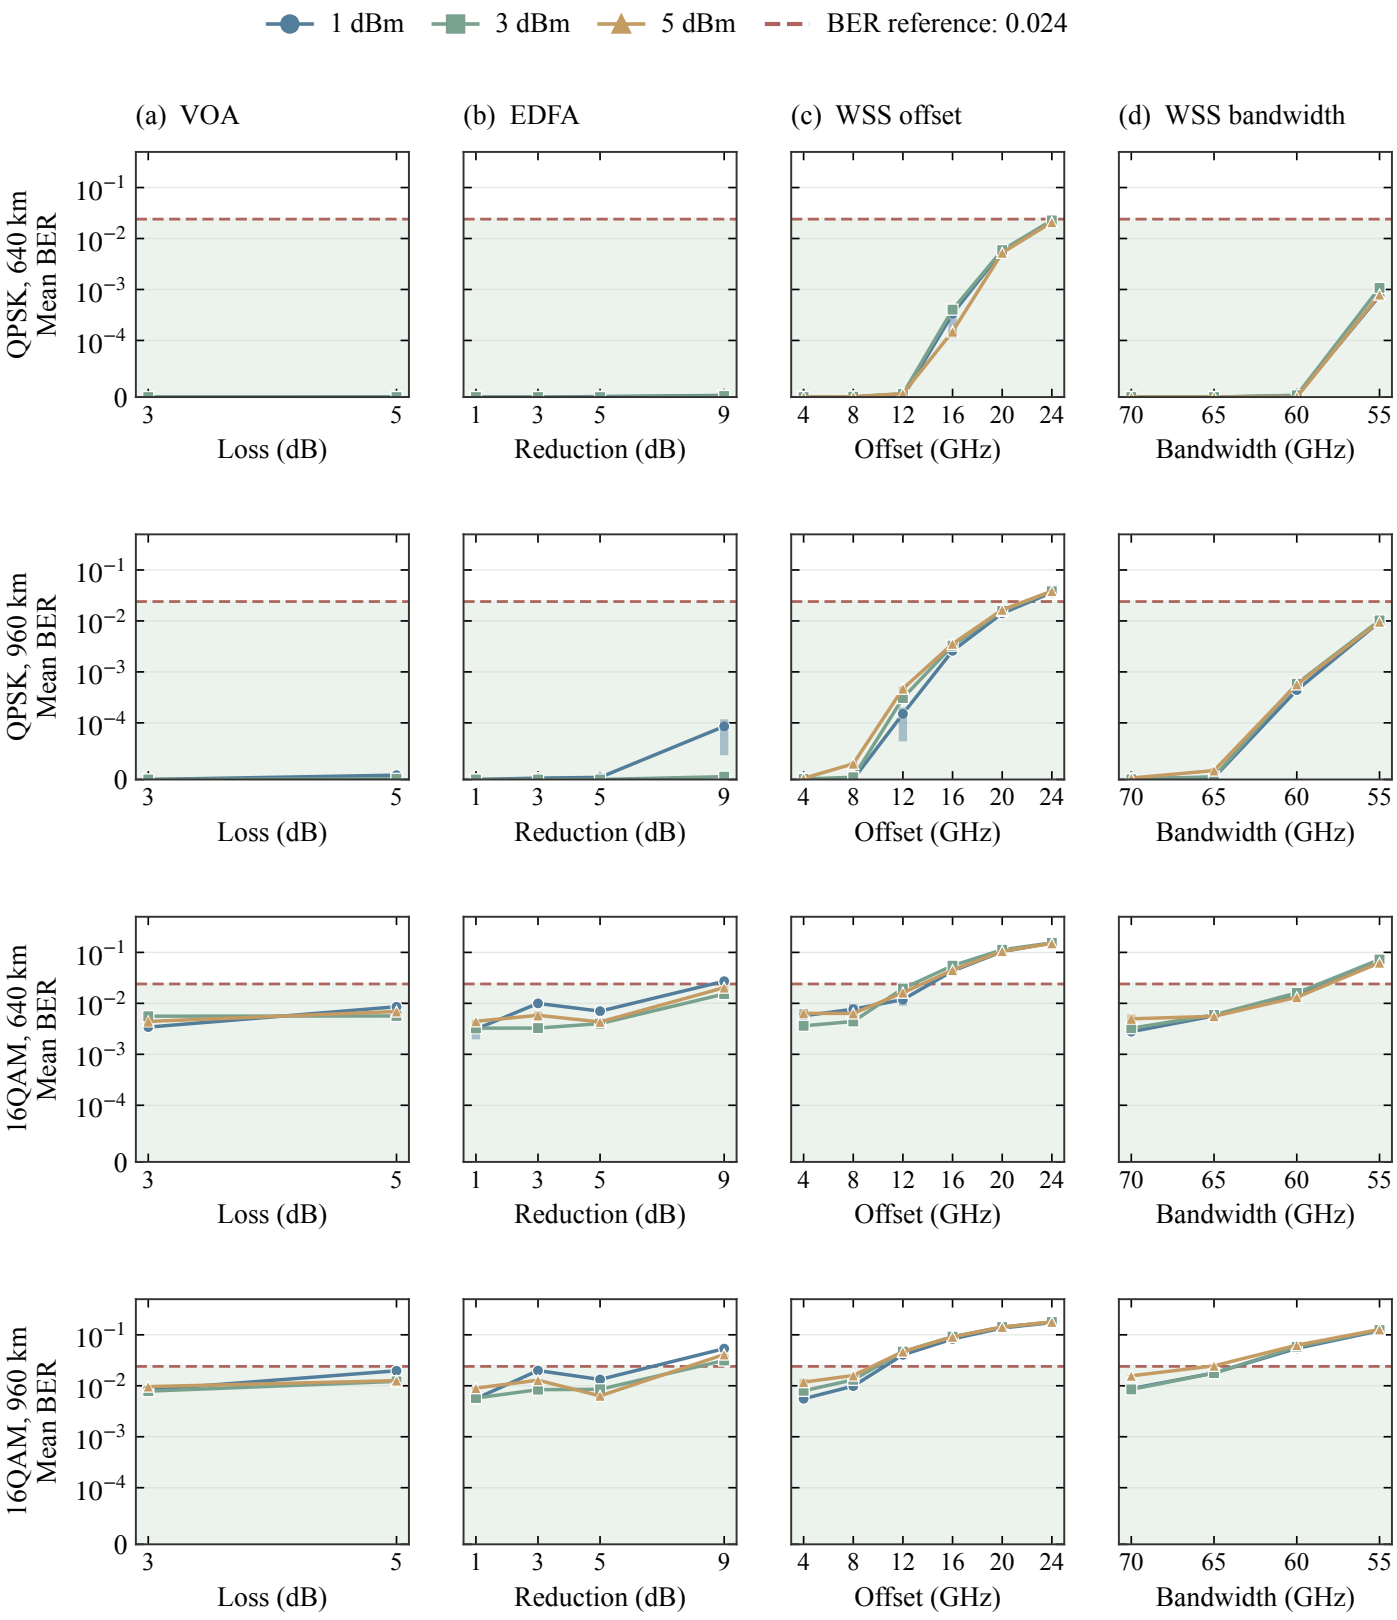
Comparative WSS-offset curves omit the sparse 1280-km series; those acquisitions remain in the complete configuration index and full primary dataset. Points and spans use accepted repeats.

S2.6 | BER | WSS bandwidth narrowing



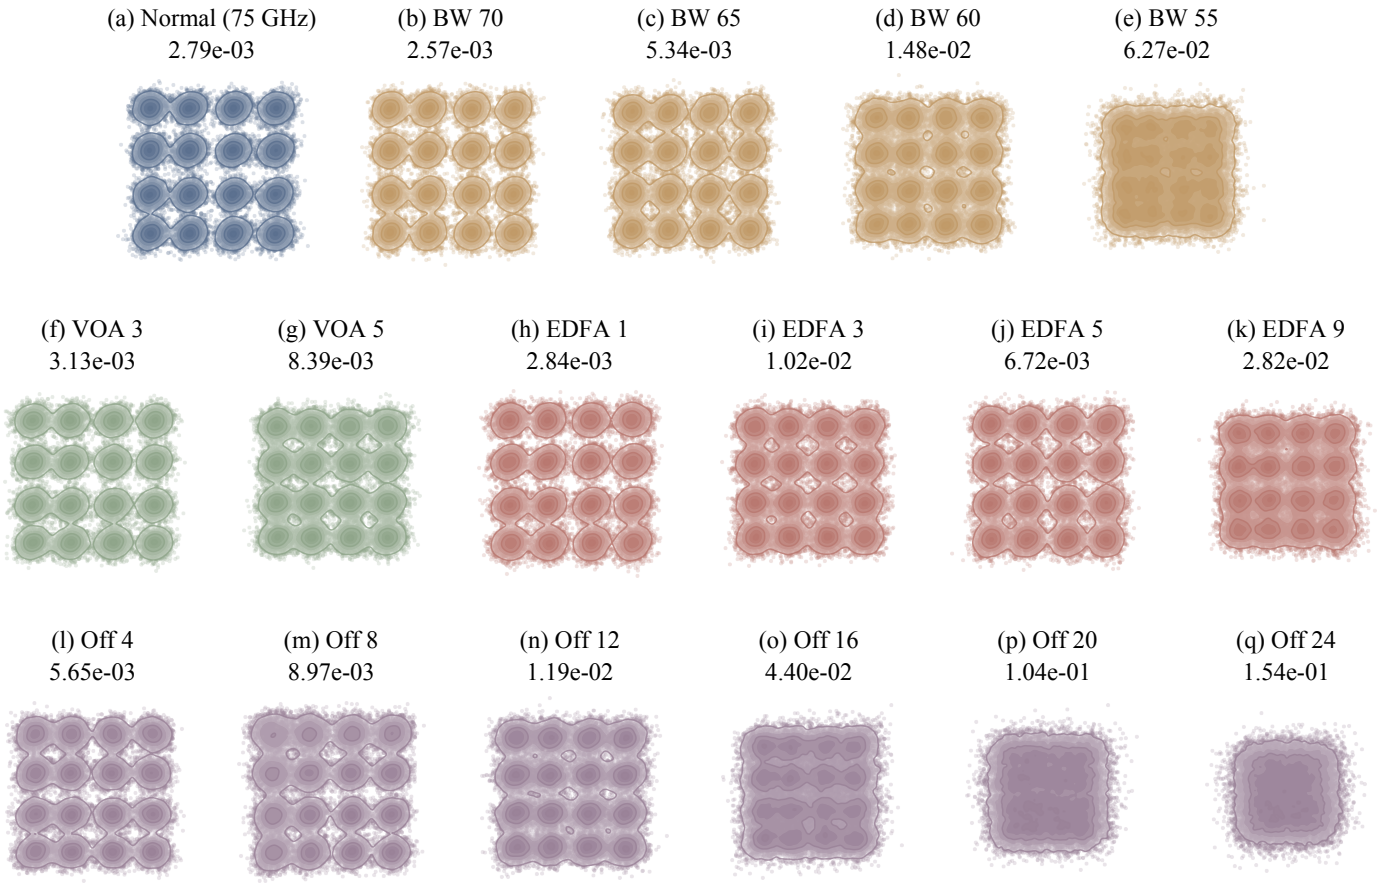
Fault panels fix modulation and distance; curves identify launch power. Points are accepted-repeat means; spans are interquartile ranges, not confidence intervals. Dashed reference: 0.024. Missing is not zero.

S2.7 | BER versus setting | QPSK and 16QAM at 640/960 km



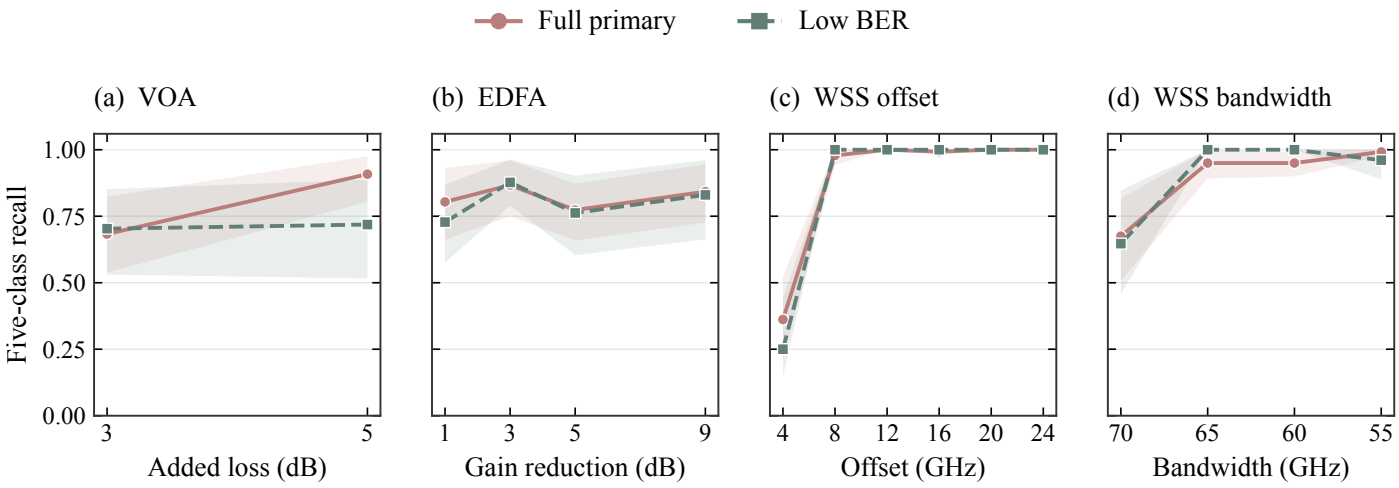
Fault panels fix modulation and distance; curves identify launch power. Points are accepted-repeat means; spans are interquartile ranges, not confidence intervals. Dashed reference: 0.024. Missing is not zero.

S2.8 | Recovered constellations | all 17 settings



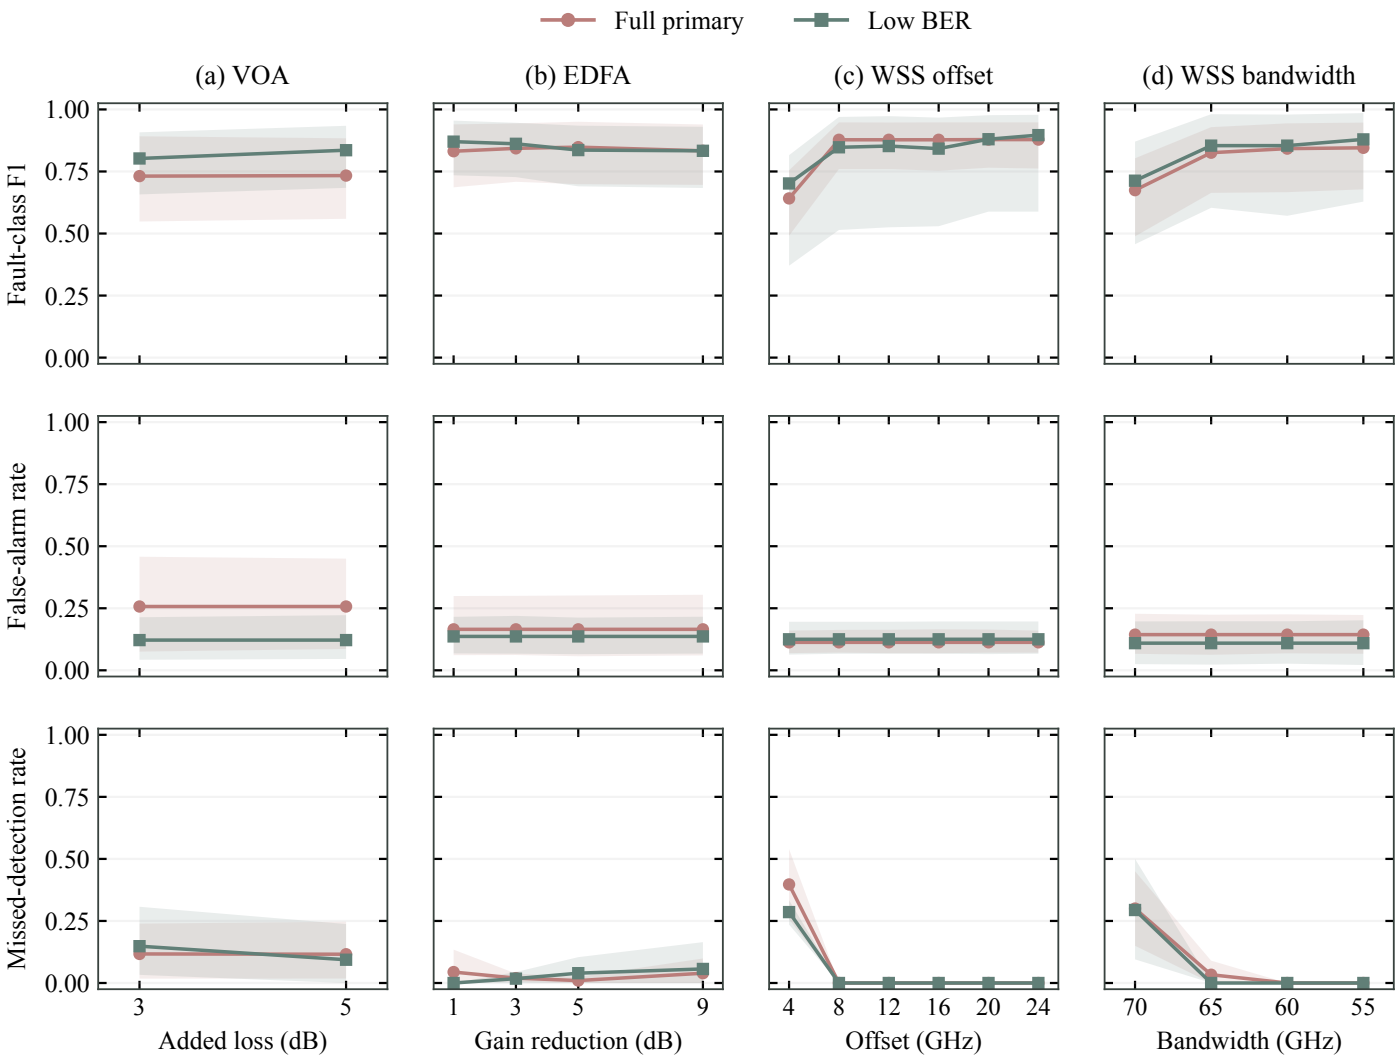
Results are grouped by the operating conditions and evaluation protocol indicated in the figure. Configuration identifiers link the figures to the accompanying data tables.

S3.1 | Five-class recognition versus setting



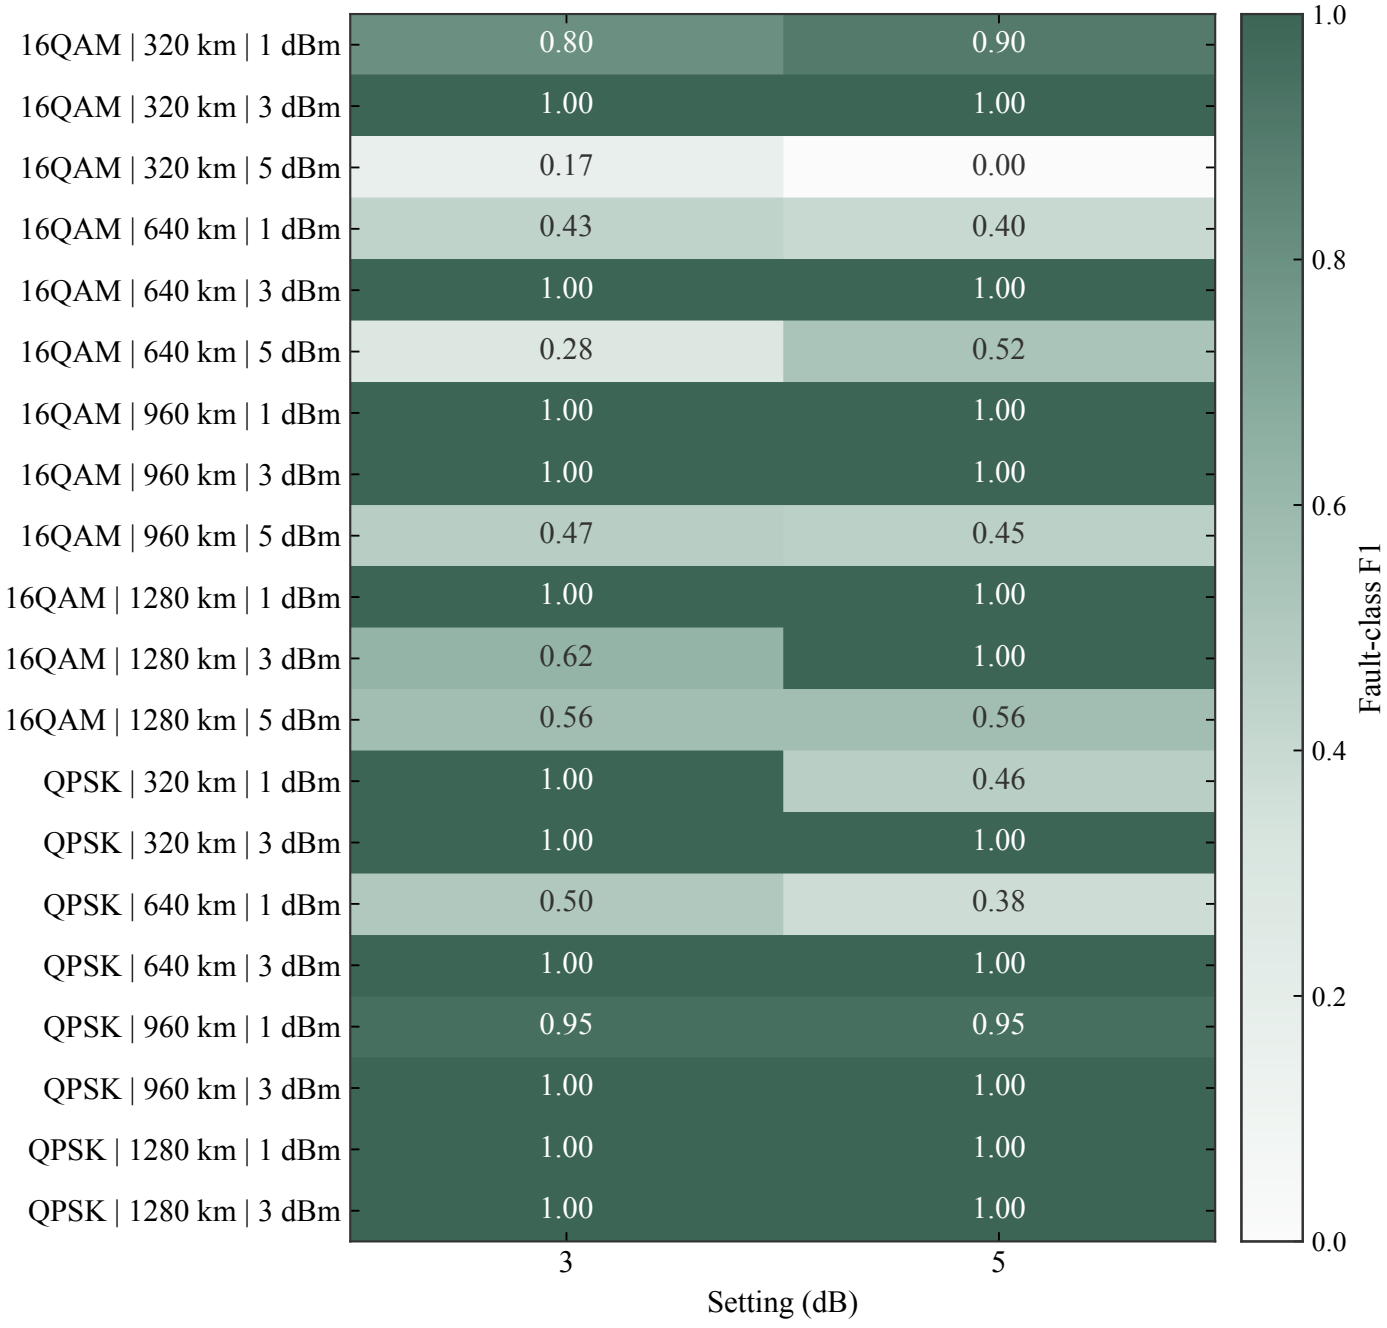
Five-class recall versus recorded fault setting for fixed LightGBM. Each mechanism uses operating-condition cells represented at all its settings, determined separately for the full and low-BER cohorts. Shaded regions are 95% configuration-bootstrap intervals.

S3.2 | Binary detection versus setting



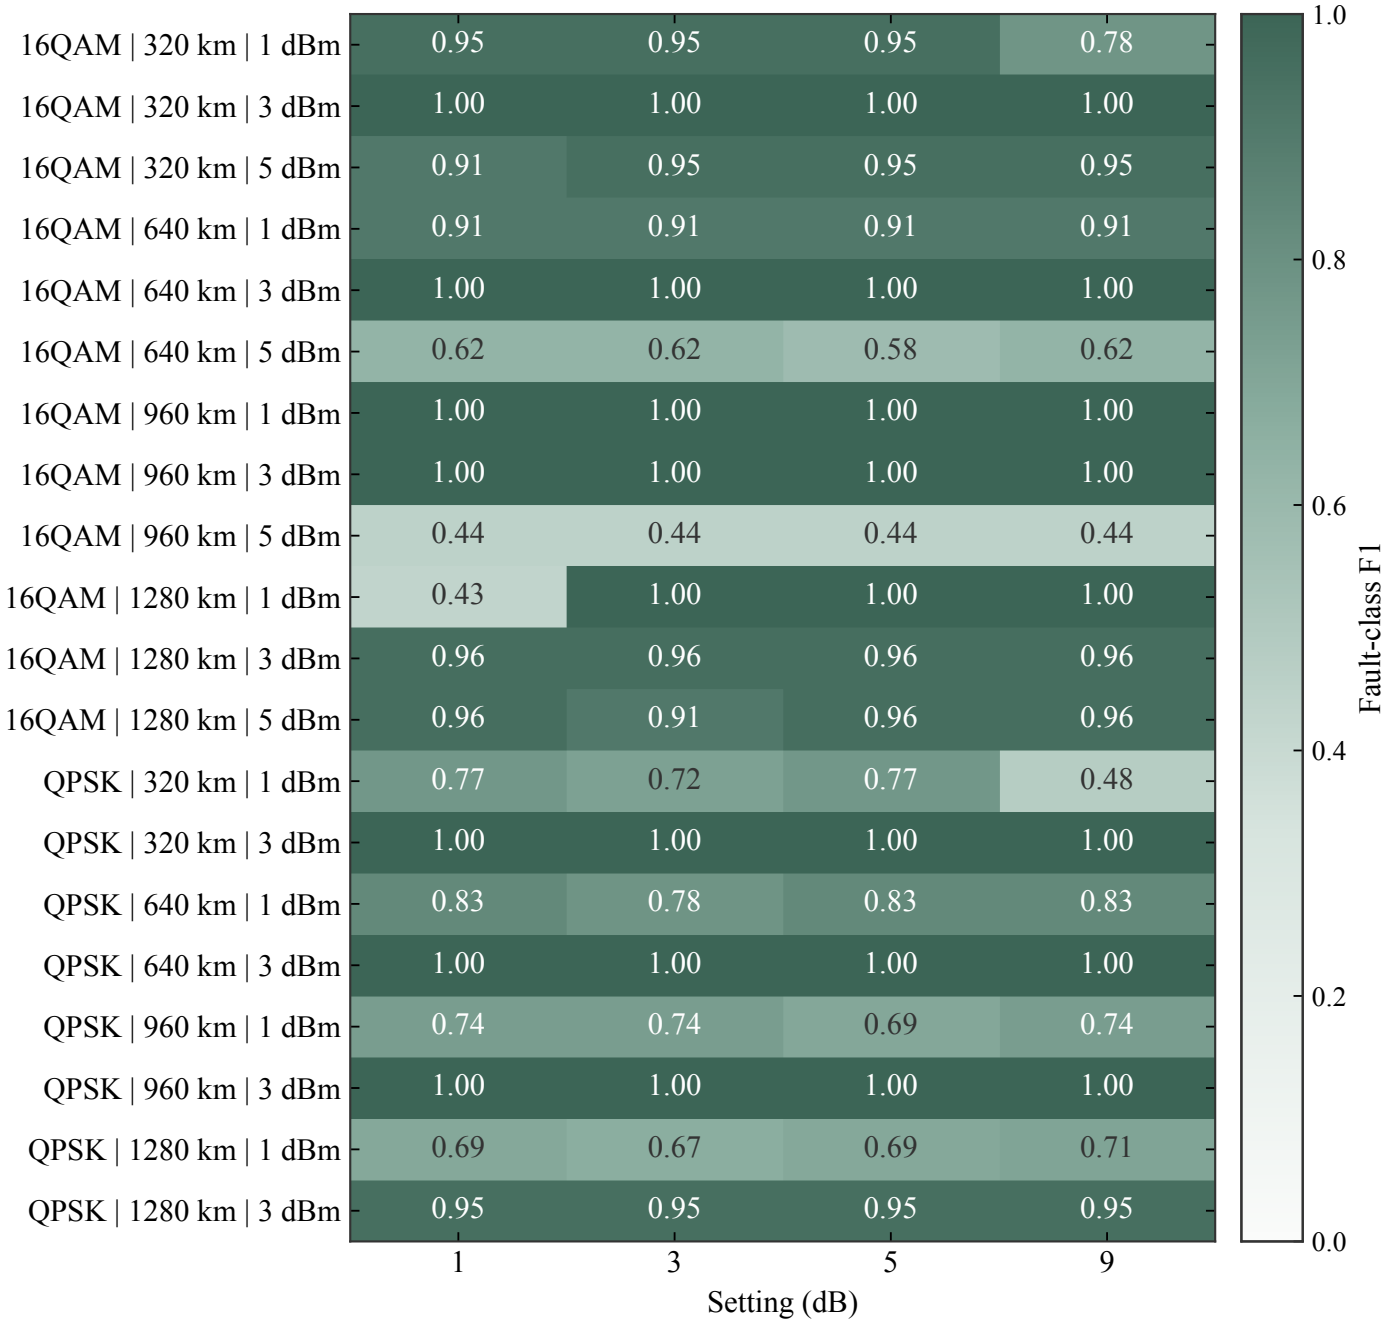
Setting-resolved normal-versus-one-mechanism detection with fixed LightGBM. Rows show fault-class F1, normal false-alarm rate, and fault missed-detection rate; columns identify the four mechanisms. Full and low-BER curves each use their common operating conditions. Shading gives 95% configuration-bootstrap intervals.

S3.3 | Exact-condition detection | exact magnitude full primary attenuation



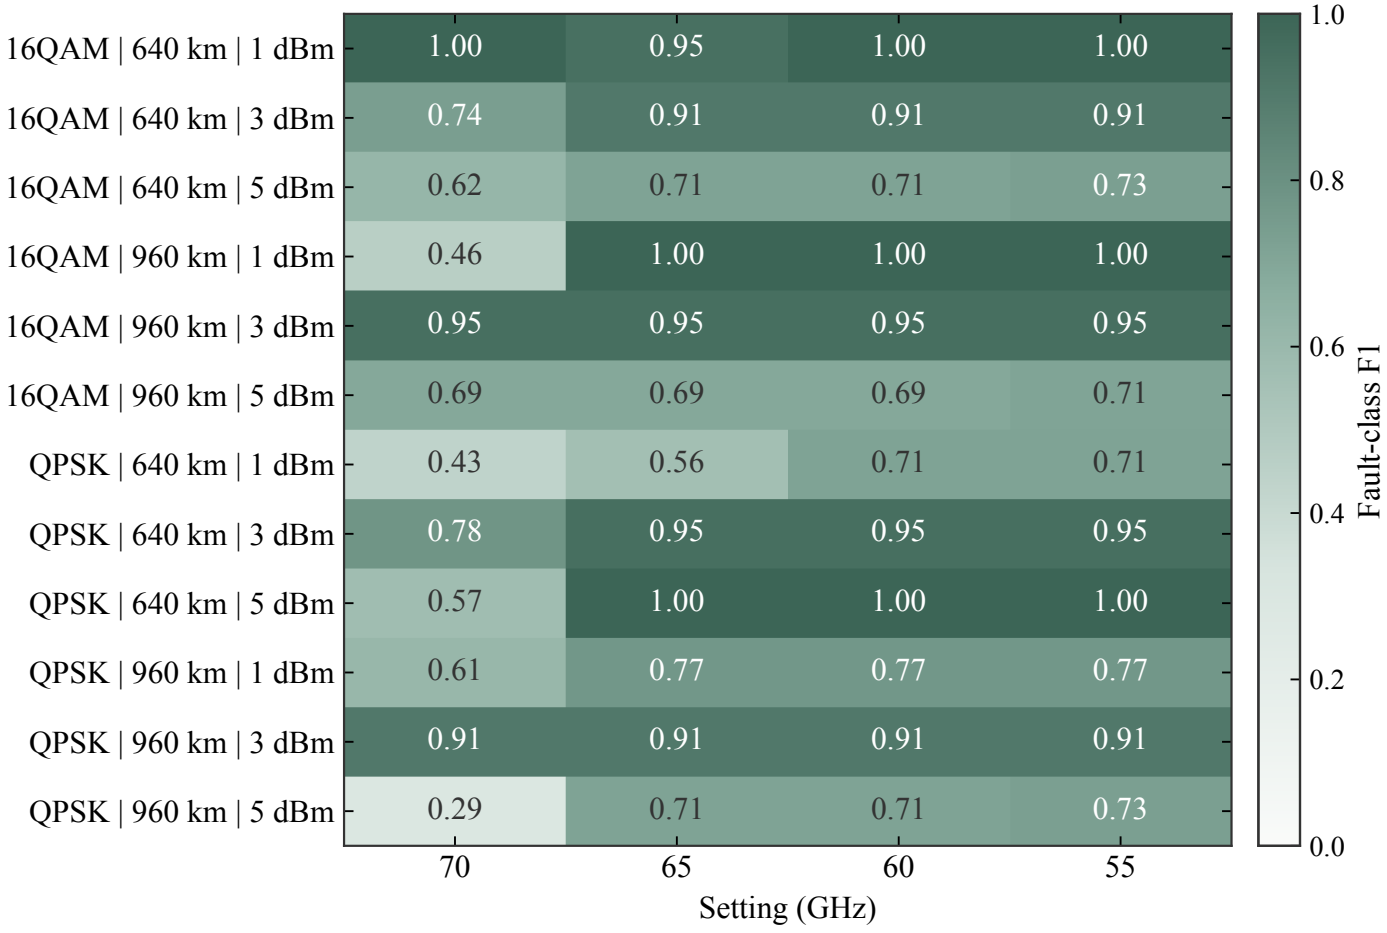
Each row fixes distance, modulation and launch power. Color encodes binary fault-class F1. Gray cells lack eligible paired support; sparse rows are descriptive.

S3.4 | Exact-condition detection | exact magnitude full primary edfa



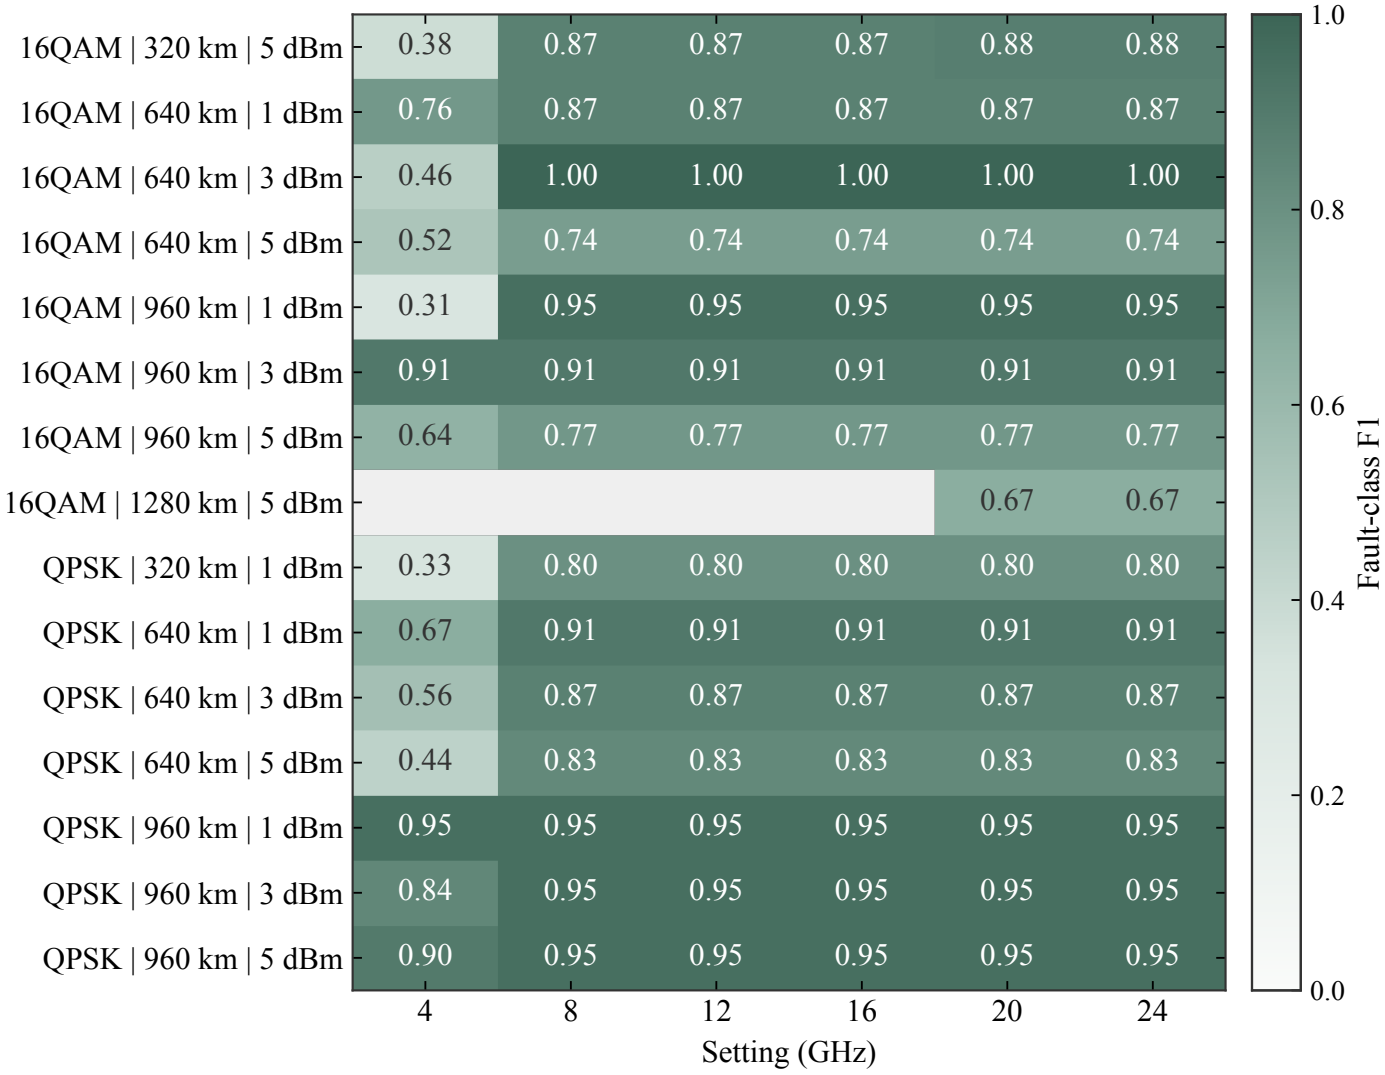
Each row fixes distance, modulation and launch power. Color encodes binary fault-class F1. Gray cells lack eligible paired support; sparse rows are descriptive.

S3.5 | Exact-condition detection | exact magnitude full primary wss bandwidth



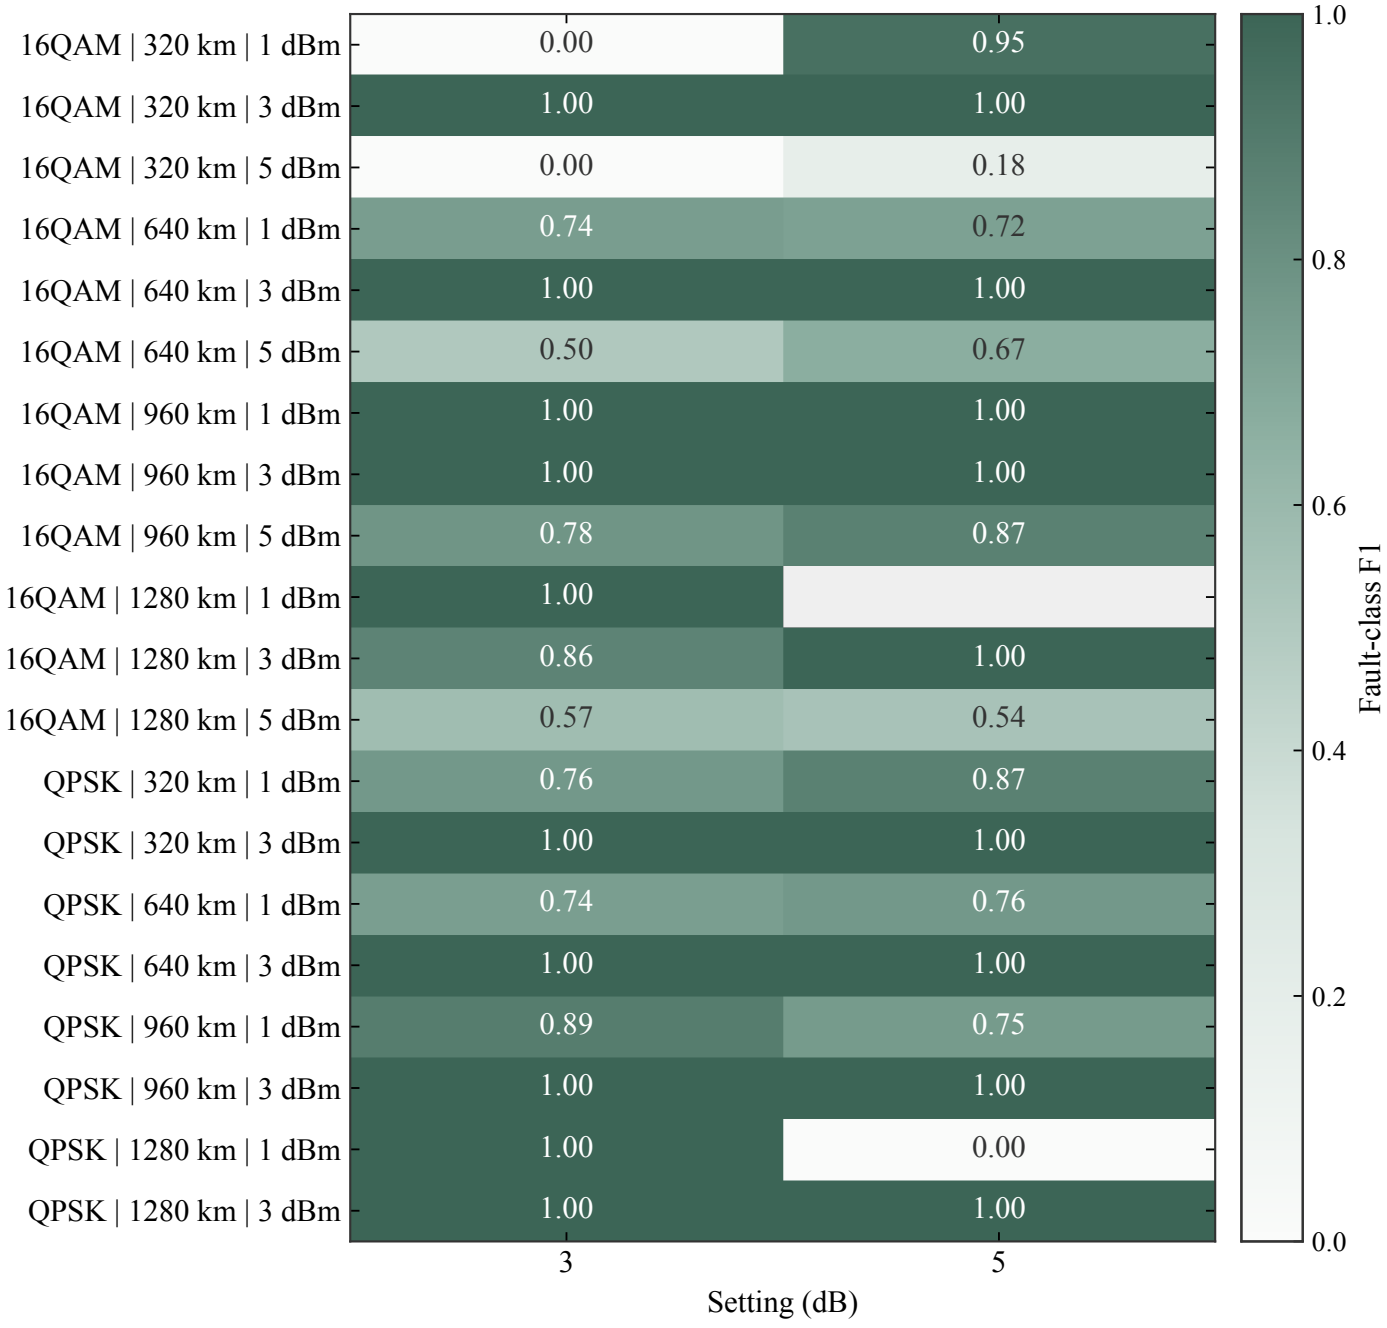
Each row fixes distance, modulation and launch power. Color encodes binary fault-class F1. Gray cells lack eligible paired support; sparse rows are descriptive.

S3.6 | Exact-condition detection | exact magnitude full primary wss offset



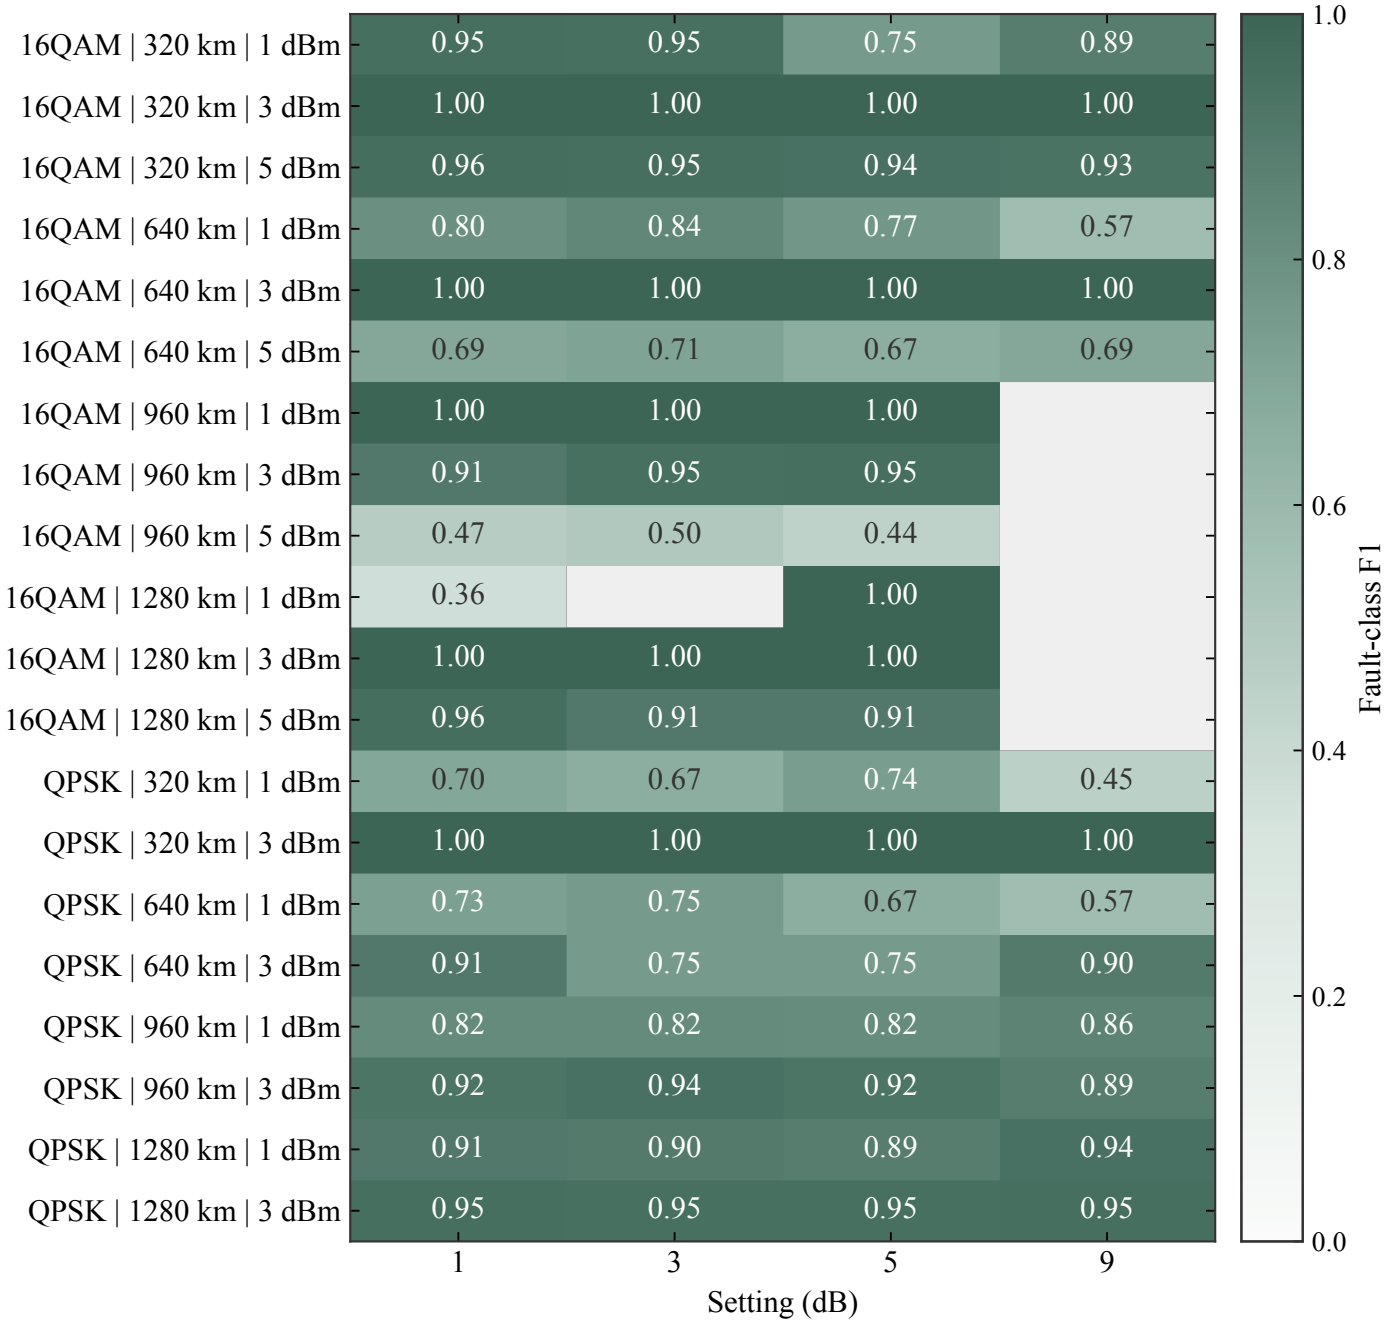
Each row fixes distance, modulation and launch power. Color encodes binary fault-class F1. Gray cells lack eligible paired support; sparse rows are descriptive.

S3.7 | Exact-condition detection | exact magnitude low BER attenuation



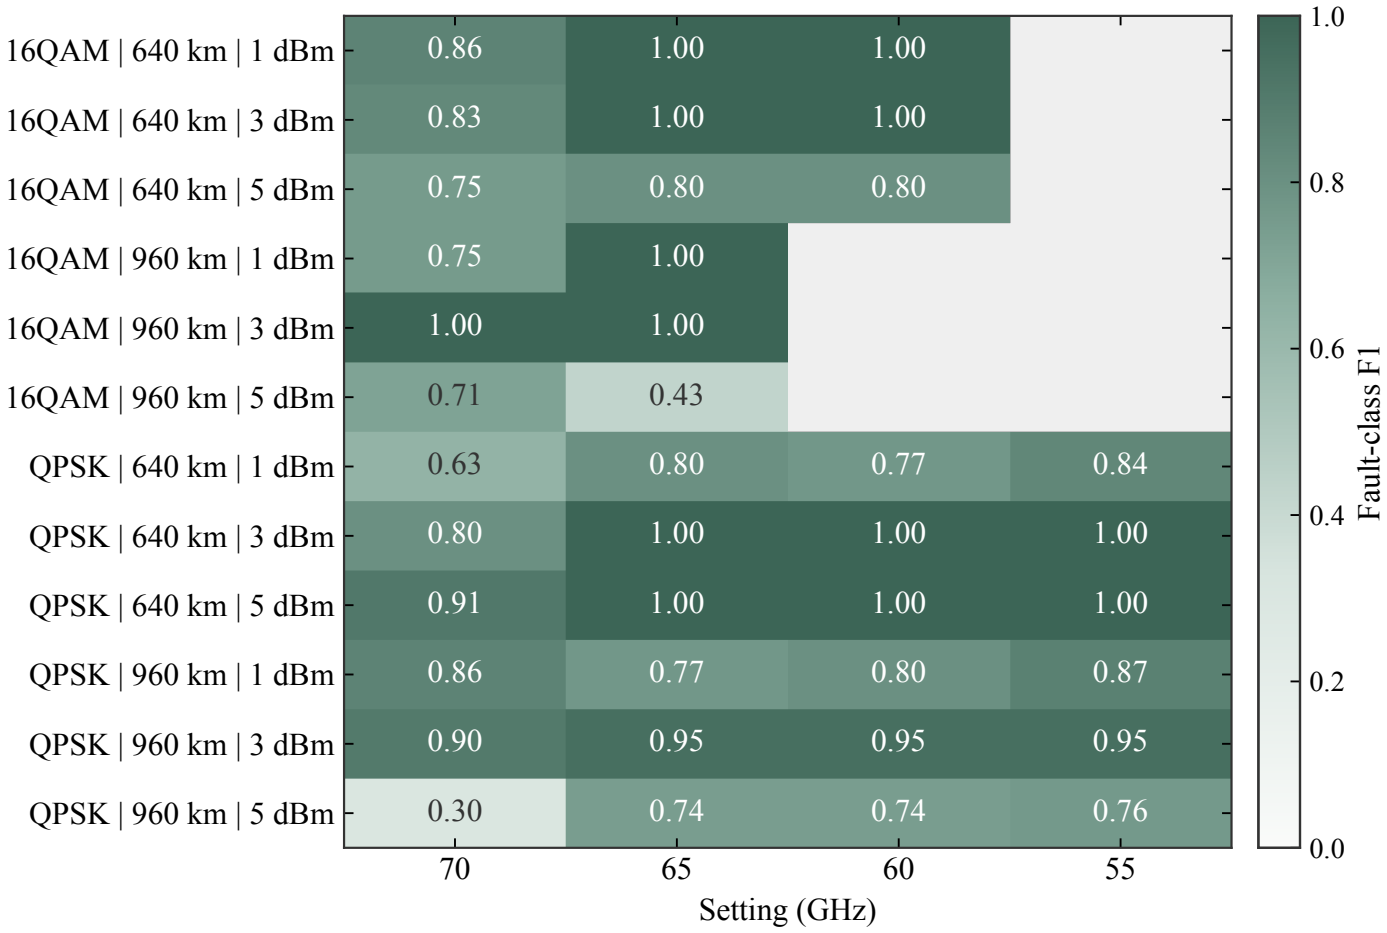
Each row fixes distance, modulation and launch power. Color encodes binary fault-class F1. Gray cells lack eligible paired support; sparse rows are descriptive.

S3.8 | Exact-condition detection | exact magnitude low BER edfa



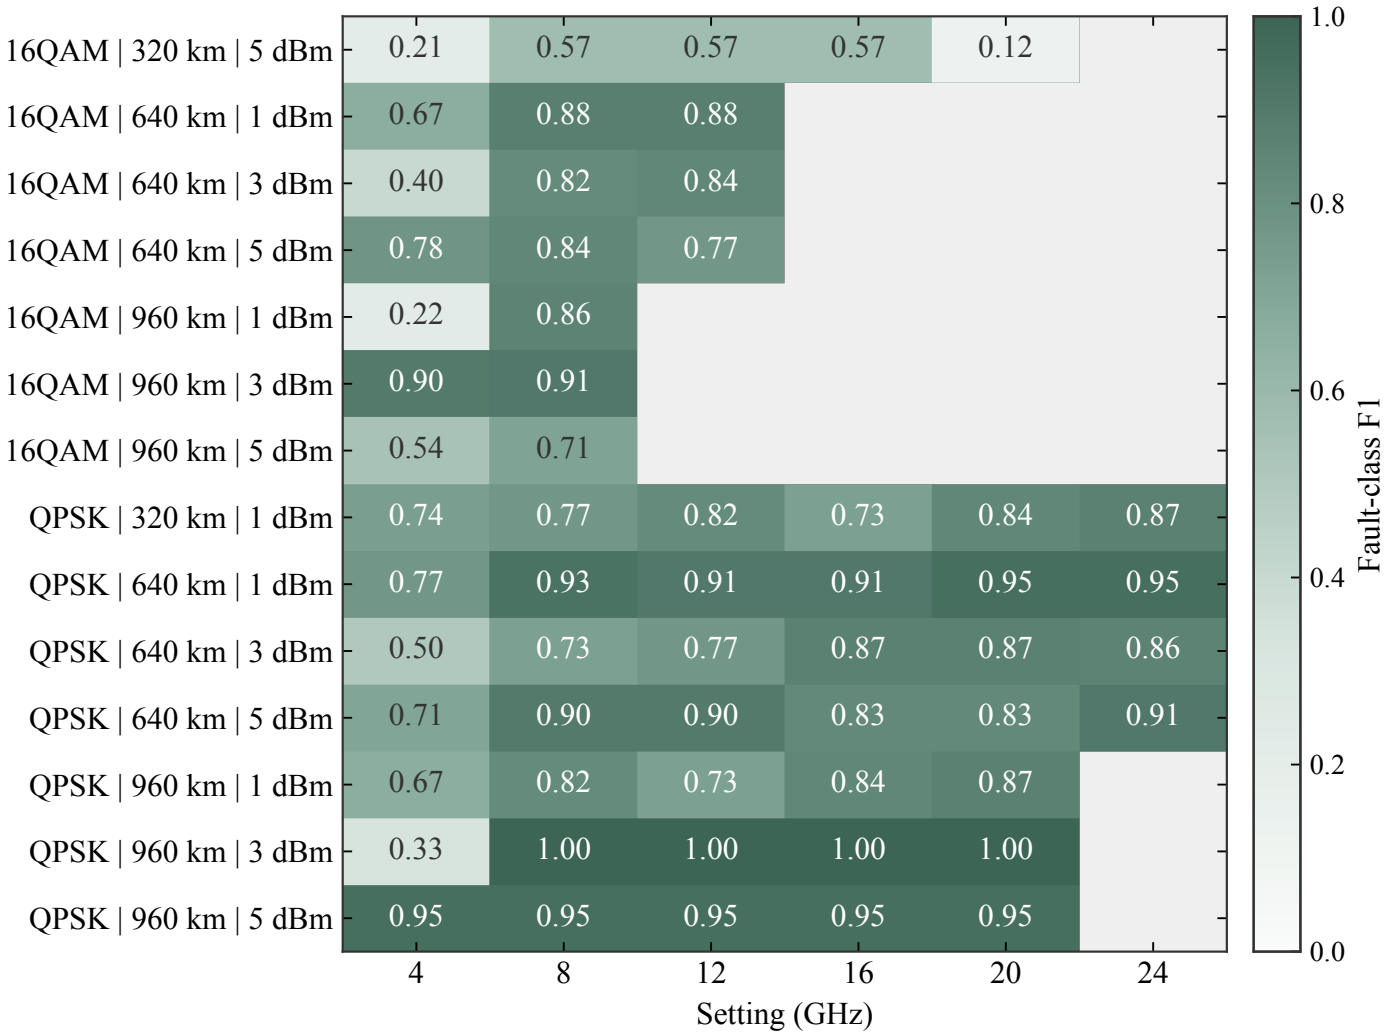
Each row fixes distance, modulation and launch power. Color encodes binary fault-class F1. Gray cells lack eligible paired support; sparse rows are descriptive.

S3.9 | Exact-condition detection | exact magnitude low BER wss bandwidth



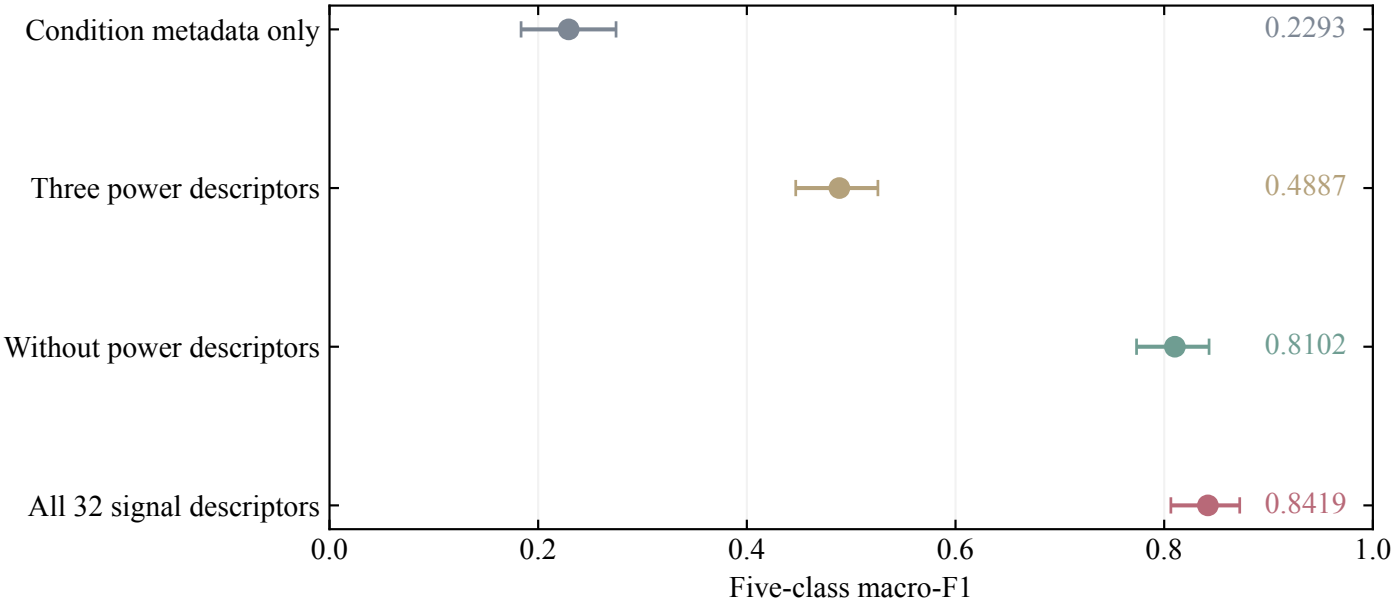
Each row fixes distance, modulation and launch power. Color encodes binary fault-class F1. Gray cells lack eligible paired support; sparse rows are descriptive.

S3.10 | Exact-condition detection | exact magnitude low BER wss offset



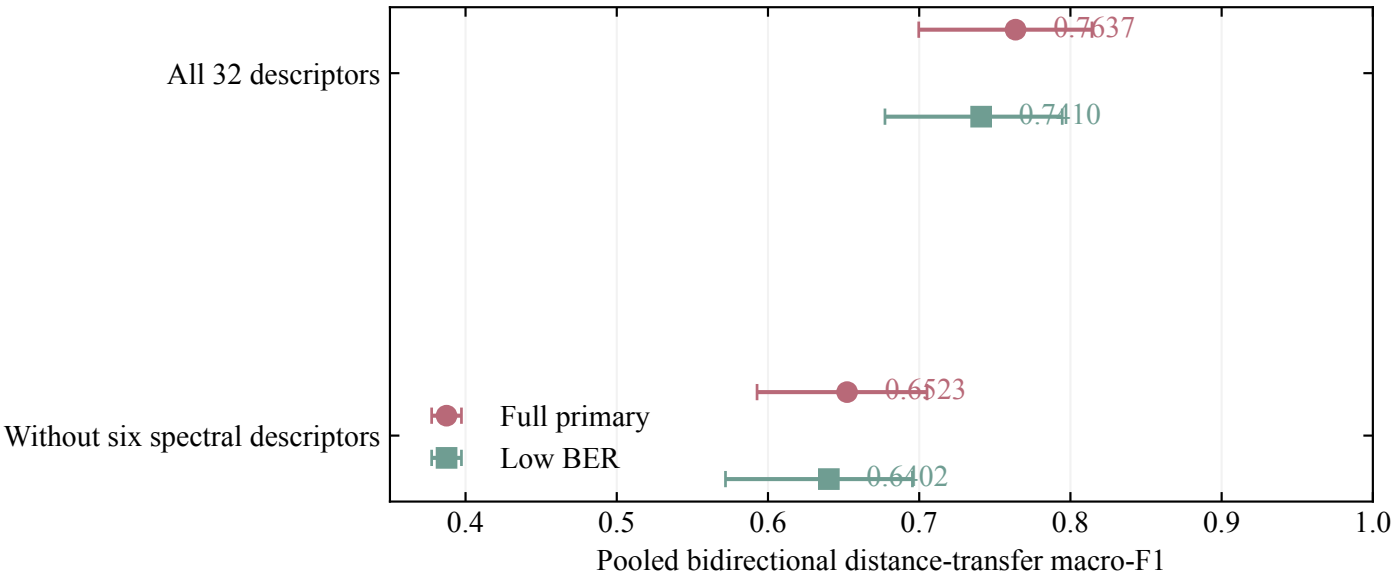
Each row fixes distance, modulation and launch power. Color encodes binary fault-class F1. Gray cells lack eligible paired support; sparse rows are descriptive.

S4.1 | Signal versus metadata and power controls



Results are grouped by the operating conditions and evaluation protocol indicated in the figure. Configuration identifiers link the figures to the accompanying data tables.

S4.2 | Paired distance transfer with and without spectra



Results are grouped by the operating conditions and evaluation protocol indicated in the figure. Configuration identifiers link the figures to the accompanying data tables.

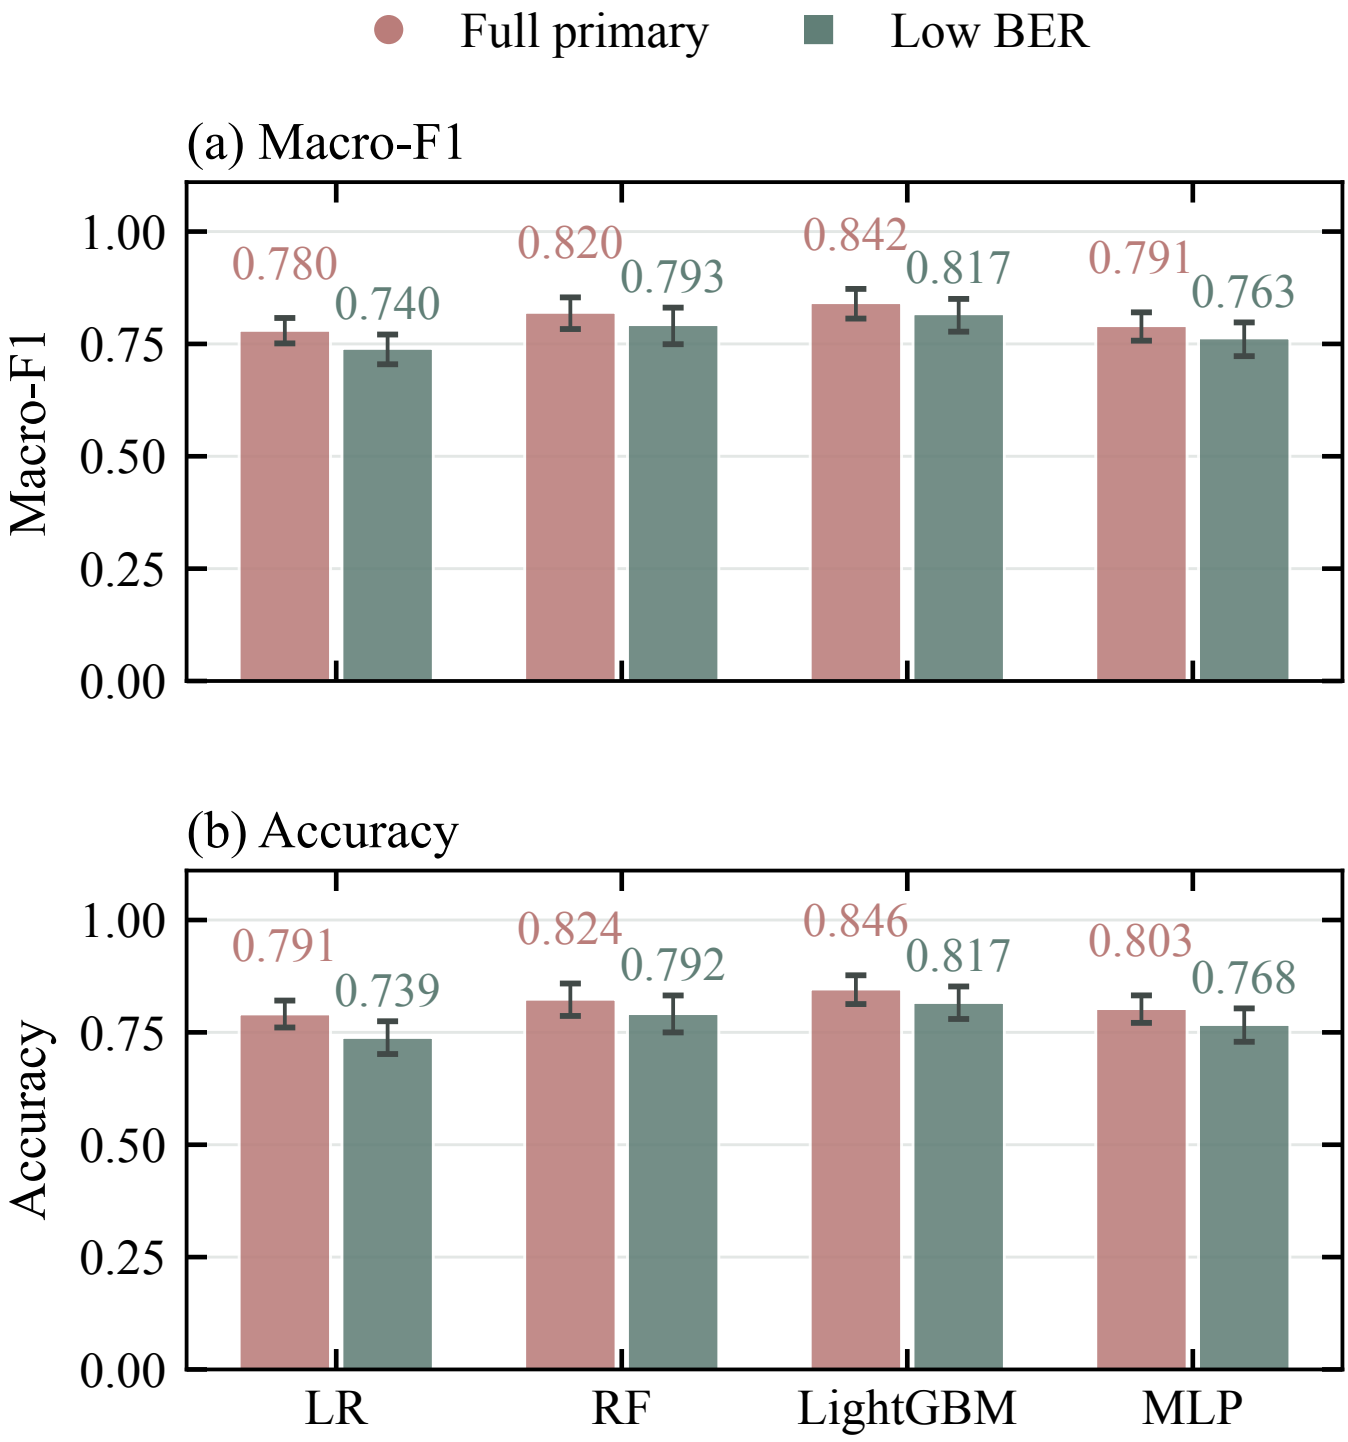
S5.1 | Acquisition-date and training-cohort comparisons

Acquisition-date grouping: one date contains 990 captures (989 at 5 dBm; one launch-power value unrecorded). The other contains 2365 captures (1214 at 1 dBm; 1151 at 3 dBm). Bidirectional full-set macro-F1 values are 0.4960 and 0.2887; pooled values are 0.4064 for the full set and 0.4142 for the low-BER set. Date and launch power change together. This is a combined-condition stress test, not an isolated date effect or an independent-session evaluation.

Paired low-BER test membership: full-cohort training gives 0.8194 macro-F1, versus 0.8002 for low-BER-only training. The paired configuration-bootstrap interval for the difference is [-0.0412, -0.0007]. These predictions use inherited full-cohort folds, not the independently refolded baseline.

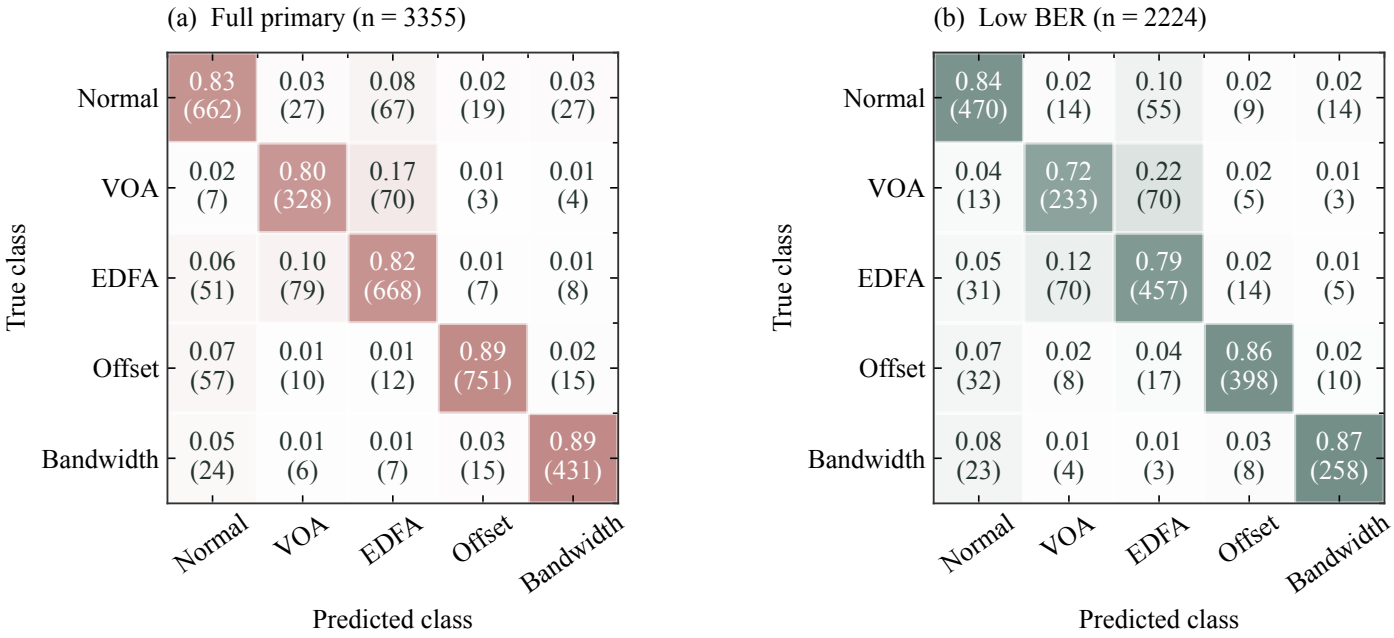
All results summarize saved predictions; no new raw-signal processing is implied.

S6.1 | Reference classification



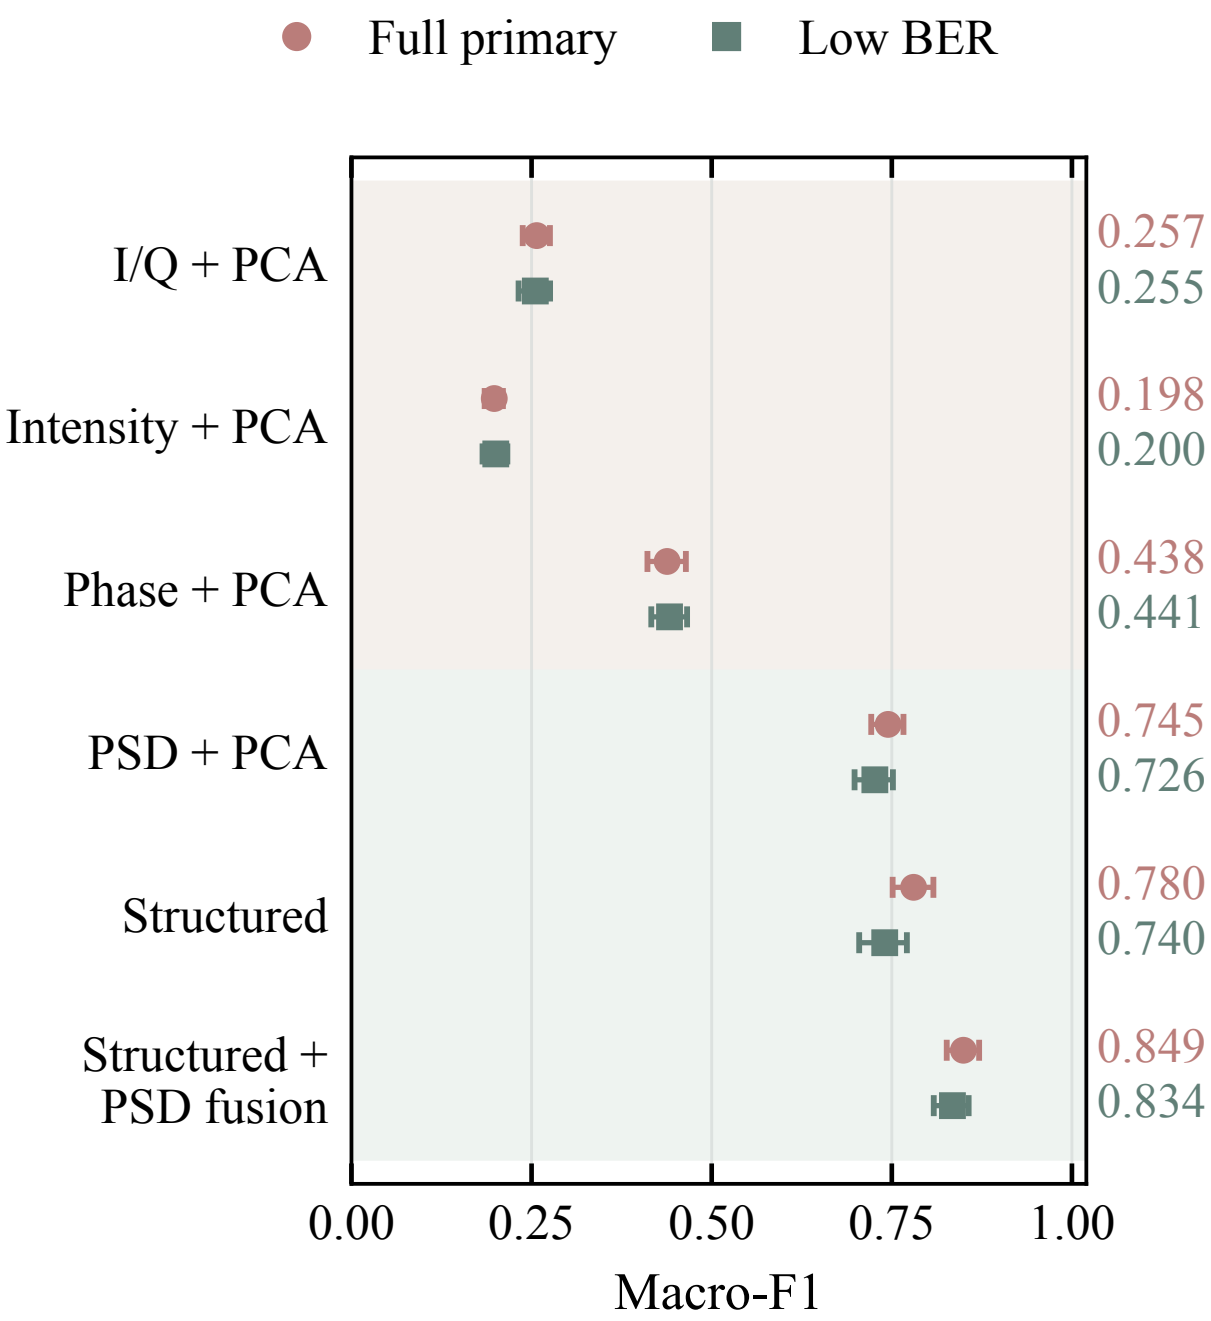
Five-class performance of logistic regression, random forest, LightGBM, and MLP under configuration-grouped evaluation: (a) macro-F1 and (b) accuracy. Rose and sage bars denote the 3355-capture primary set and the 2224-capture low-BER subset. Error bars are 95% configuration-bootstrap intervals.

S6.2 | Five-class confusion matrices



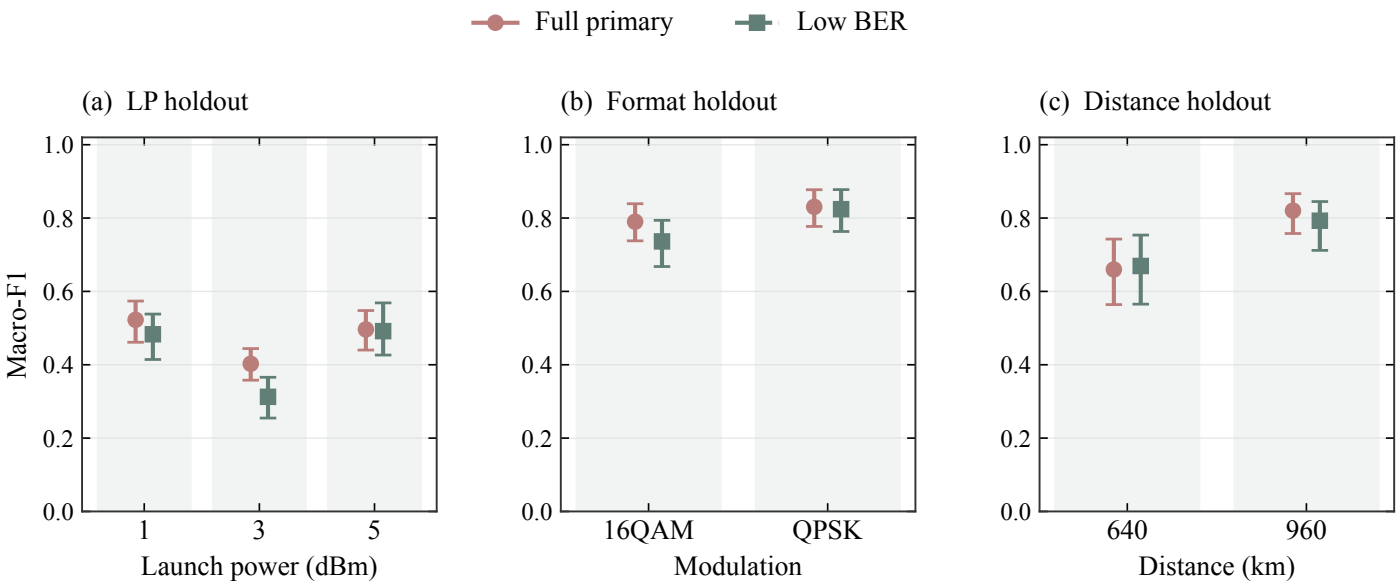
LightGBM five-class confusion matrices for the full primary and low-BER cohorts. Cells show row-normalized proportions and capture counts in parentheses. The matrices and scalar metrics use the same out-of-fold predictions.

S6.3 | Signal-representation comparison



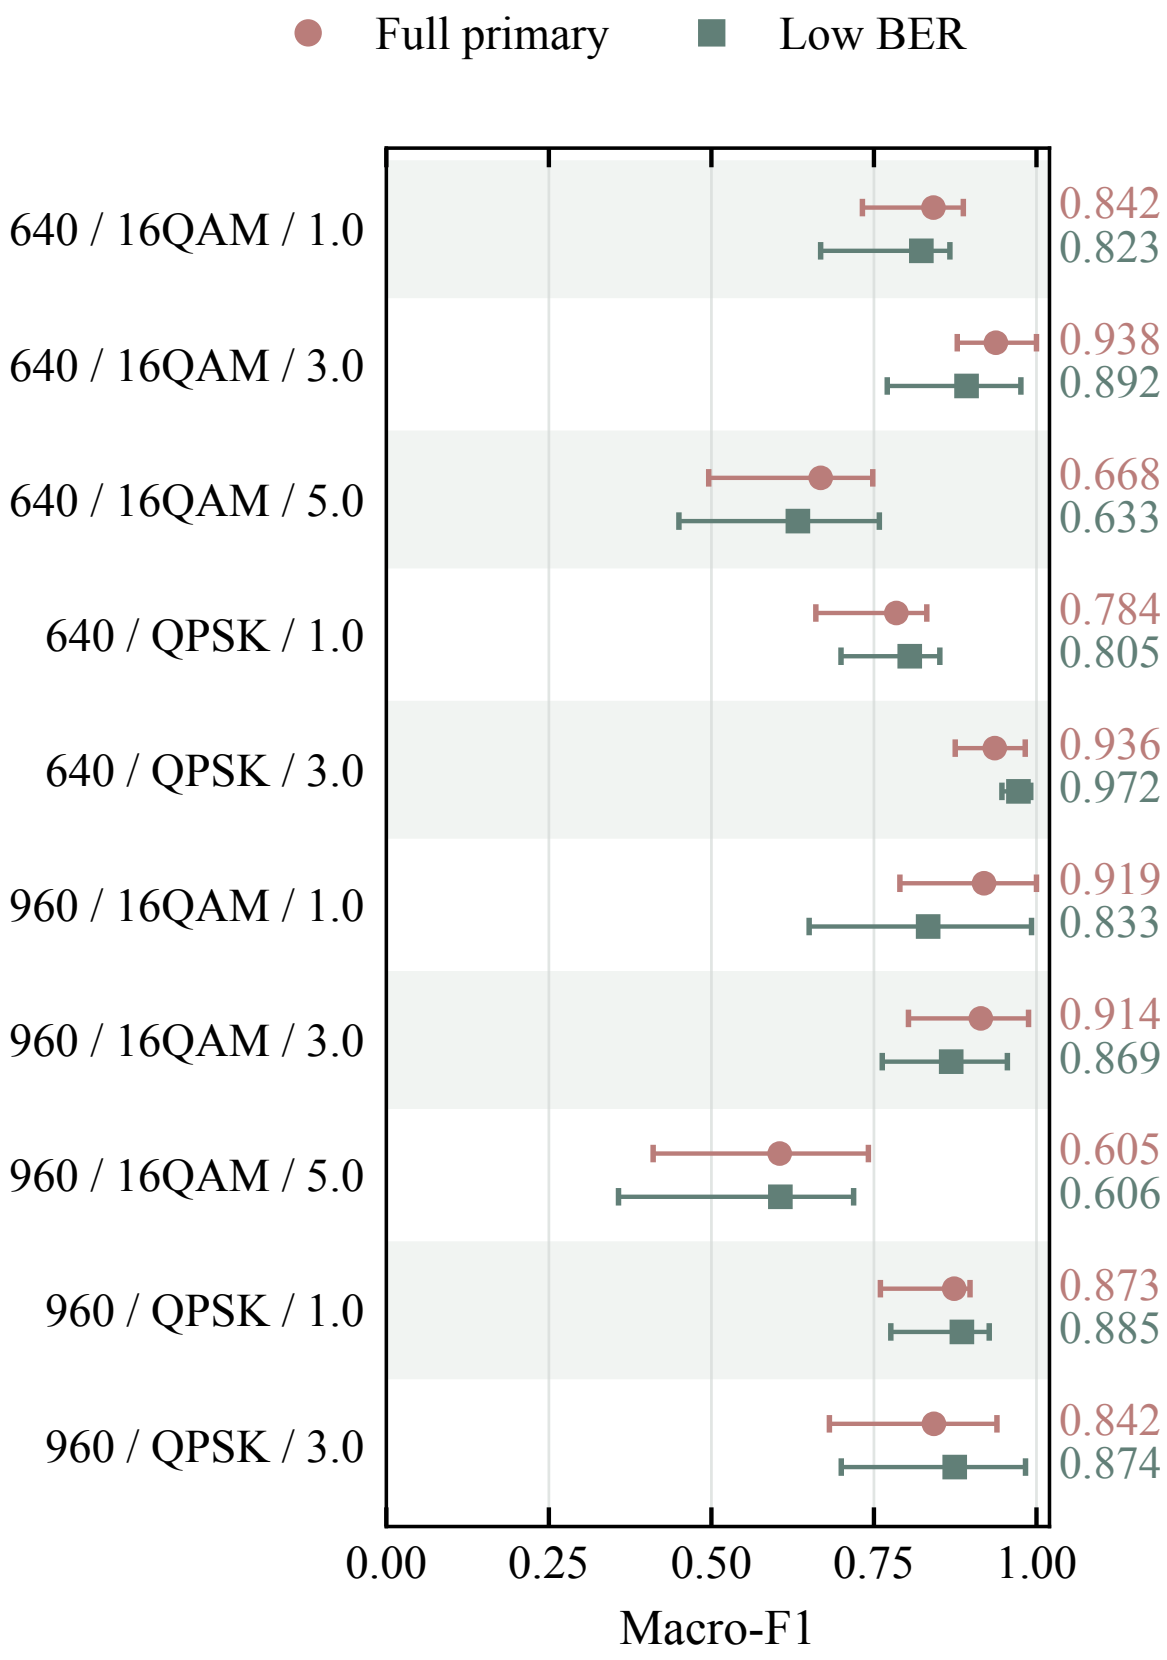
Results are grouped by the operating conditions and evaluation protocol indicated in the figure. Configuration identifiers link the figures to the accompanying data tables.

S6.4 | Held-out operating-condition values



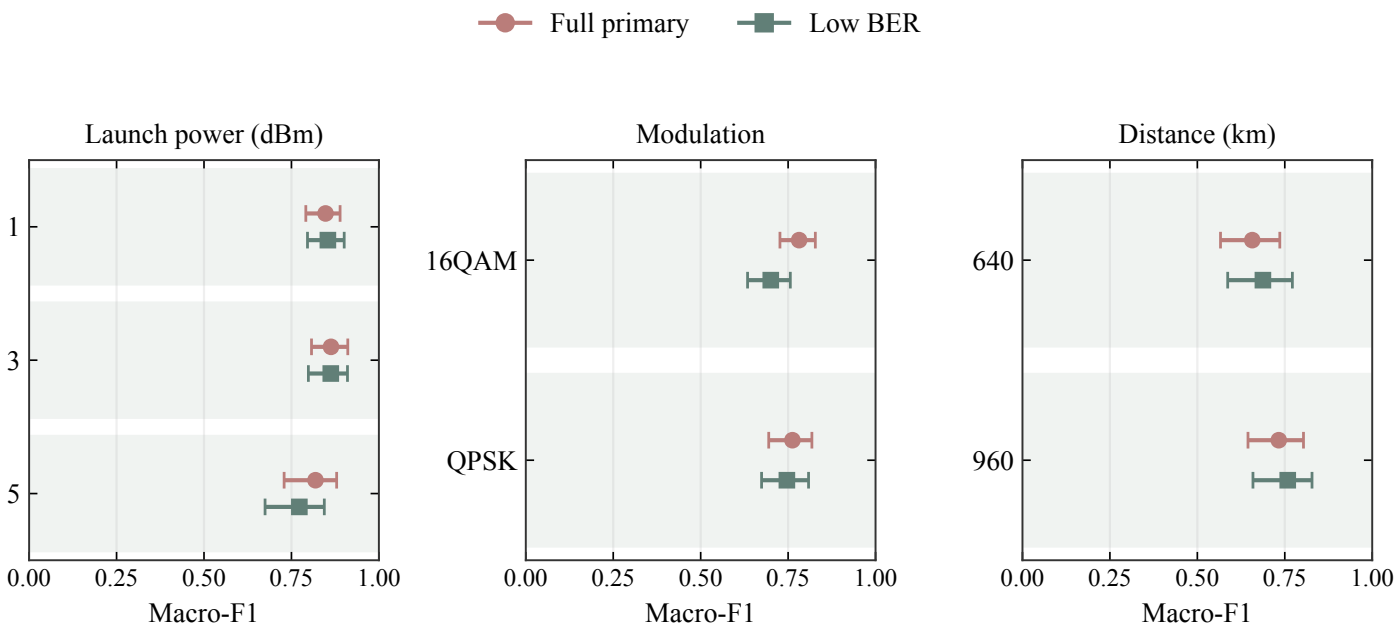
LightGBM transfer to held-out launch-power, modulation, and distance values. Training excludes all captures with the tested value. Full primary and low-BER cohorts are evaluated on directions containing all five classes in both training and test sets. Error bars are 95% configuration-bootstrap intervals.

S6.5 | Complete operating-condition holdout



Five-class performance for held-out distance?modulation?launch-power combinations. All training captures from the tested combination are excluded. Full and low-BER results use their respective eligible cells; intervals resample test configurations.

S6.6 | Within-condition models | within condition



Within-condition modeling shares the named condition between training and test; this is not transfer to an unseen condition. Intervals resample saved configuration-group predictions.

Configuration-indexed constellations

All 299 primary physical configurations are included.

For a configuration with accepted DSP outputs, the representative capture is selected nearest to the mean BER of those outputs. Its BER and the configuration mean are displayed separately.

295 configurations have a valid representative candidate. Four have no valid DSP output and retain a missing-image entry.

This appendix preserves every acquired setting; it does not imply balanced five-class support at every distance. No synthetic constellation coordinates are used.
